Black hole mass →

?

Accretion geometry / torus height depend on halo mass?

Summary

1. With Spitzer we obtain equivalent (large) samples of **obscured** and **unobscured quasars** at $z \gtrsim 1$.

2. **Obscured** and **unobscured quasars** are found in similar large-scale environments, although there are hints of stronger clustering for **obscured quasars**.

Wide-Field X-ray Telescope (WFXT)

Large-area survey mission (0.1-6 keV)

Will detect and characterize **tens of millions of AGN**. Similar studies for AGN evolution as SDSS has enabled for galaxies.
