

• KP9 (Galaxy Properties)

- *Measure physical properties of low z galaxies (structure, local SFH)*

Other KPs?

- Perhaps use our results to correct biases in unresolved galaxy pop?
- *Correlate with spectroscopic data and environmental measures to deduce how and when various galaxy types were established*
- Incorporate multi-wavelength ancillary imaging as much as possible
- *Envisioned projects largely based on complete 3π survey*
- Heckman, Thilker, Zheng, Lucey, Tully, Meurer, Vinsen -- others very welcome!

Galaxies in PS1 MD04

At kpc scales dust and young stars pose an interpretational challenge requiring a multi-wavelength approach

- Simple science goals (yet neither achieved in vast numbers)
 - *Unbiased stellar mass maps*
 - Recoverable with two optical colors and luminosity (Zibetti+'08), but we can do better with Pan-STARRS I
 - *Recent SF distribution*
 - Generations used $H\alpha$ imaging (biased at low rates)
 - 1st order answer from *grizy* but with signif. uncertainty
 - UV and IR data needed to truly constrain “recent” and embedded contributions, respectively

• Pan-STARRS1 Optical Galaxy Survey (POGS)

- Meant to supersede common nearby galaxy catalogs - UGC, ESO, RC3
- All sky ($\delta > -30^\circ$) coverage from PS1 3pi
- Dual-selection by isophotal size and magnitude
 - plus distant comparison sample
- Fundamentally *panchromatic* (UV-opt-IR)
- Pixel SED fitting for *resolved physical interpretation*
 - maps of stellar mass, SFR, age, extinction, etc.
- Detailed multi-wavelength parametric galaxy decomposition
 - “meaningful” bulge/disk ratios, scalelengths, break radii
- **Citizen-scientist involvement in multiple ways**

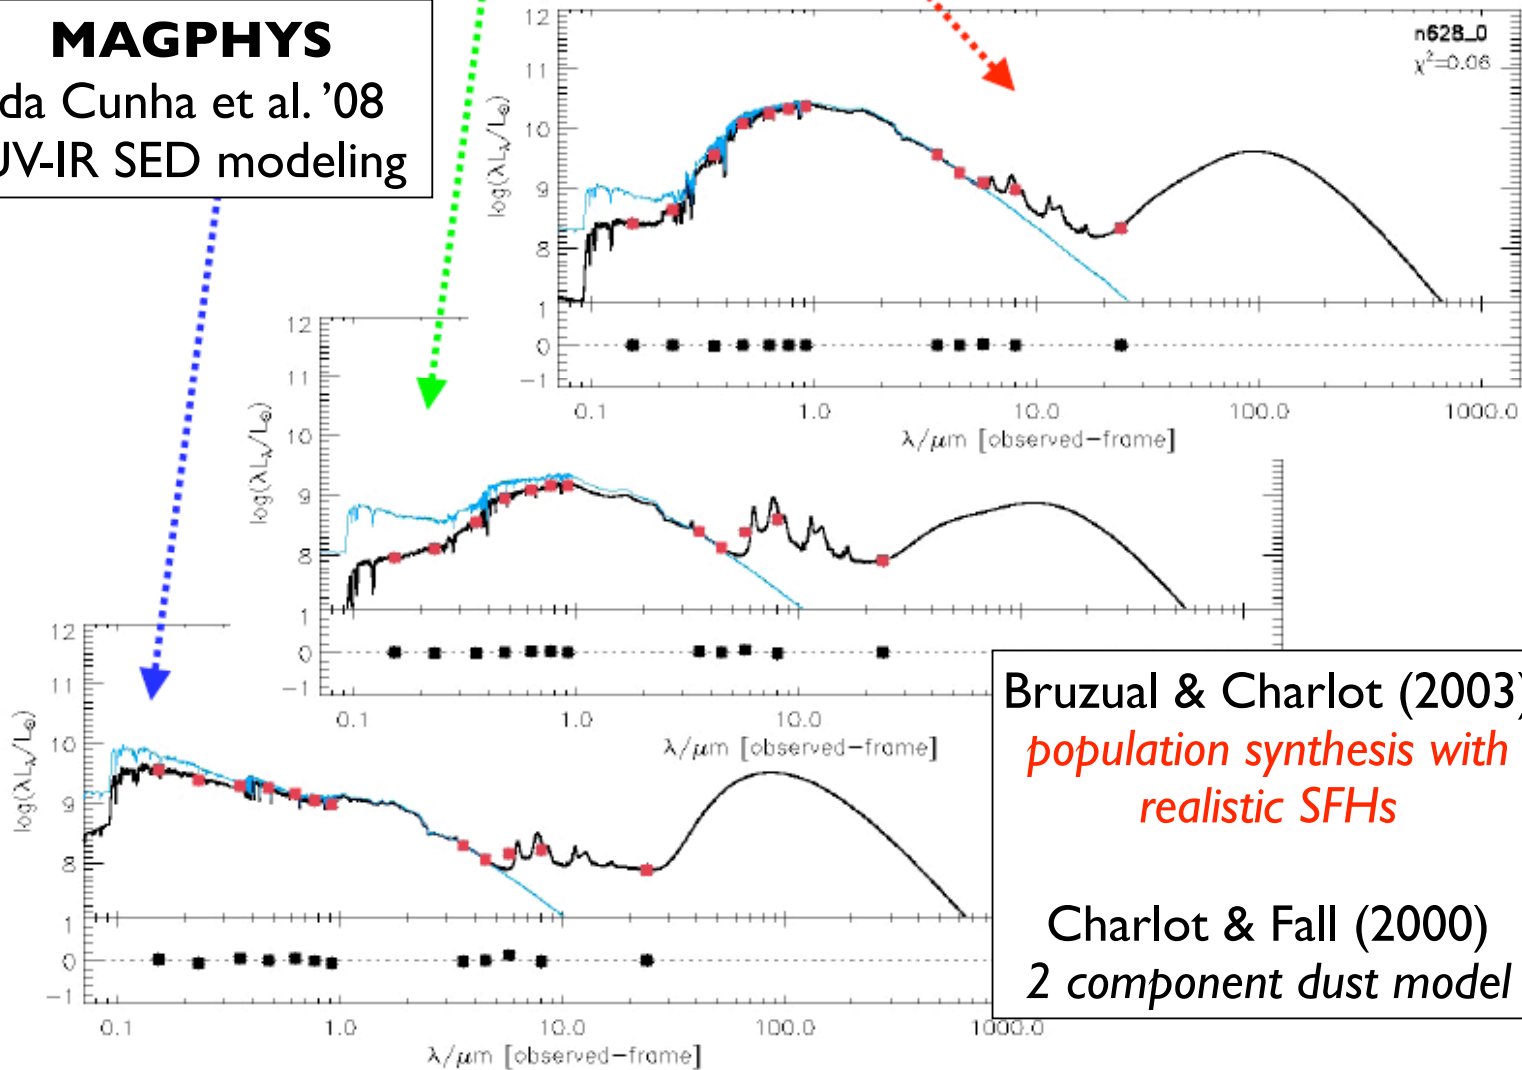

Hawaiian POGS

For each galaxy!

MAGPHYS
da Cunha et al. '08
UV-IR SED modeling

Bruzual & Charlot (2003)
*population synthesis with
realistic SFHs*

Charlot & Fall (2000)
2 component dust model

- **MAGPHYS takes brute force approach to UV-IR SED fitting**
 - Compares data to each possible model in large multi-dimen. parameter space
 - Allows estimation of marginalized probability distribution for each param.
 - But far too compute intensive to do pixel-based fits on a single machine
 - Several minutes per pixel-SED fitted
 - Faster alternatives involving Markov-Chain techniques being investigated
- **Distributed computing / citizen-science allows SED processing**
 - Project server + MAGPHYS wrapper now up and running! (thanks to Kevin Vinsen)
 - We feed multi-extension FITS files w/ res. matched panchromatic images per galaxy
 - Running development sample galaxies on Amazon before a move to “local” server

- Since the August Durham meeting, we started processing SAS2 galaxies
- first just a few targets...

David Thilker

• then a flood of SAS2 galaxies - $\log(M_{\text{star}})$

David Thilker
Johns Hopkins

Pan-STARRS
PS1 Science Consortium

Durham
9 Jan 2013

- then a flood of SAS2 galaxies - $\log(\text{SFR}_{0.1\text{Gyr}})$

- POGS galaxy sample (actually one nearby and one distant)

Sample	Selection	N(galaxies)	pixel-SED bands
UV+opt+IR base	$D25 > 1$ arcmin	~ 30,000 (total)	GALEX FUV, NUV ; [SDSS u]; PS1 $grizy$, WISE $W1, W2, W3, W4$
	$r < 18$ ABmag + $0 < z < 0.025$		
Distant comparison	GAMA spec- z or PS1 photo- $z < 0.25$	>200,000	$ugrizYJHK$

- Estimated pixel tally and processing strategy (feasible with volunteer growth)
 - 100 Million 1.5" pix for "base" sample targets
 - ~900 Million 0.5" pix for distant comparison
 - Will start with performance tests, then GAMA while waiting for 3pi, then base sample and eventually distant sample (to the level quoted above within ~3 yrs)

- **POGS data sources**

- 1" / Optical (grizy) ... PS1 3pi survey

More? • 1.3" / Optical (u-band) ... SDSS DR9, including Stripe 82 (when available)

- 5" / FUV, NUV ... GALEX (various surveys)

- 6" / 3-22 micron ... WISE (all-sky release)

- (Special cases) Spitzer (SINGS, SFRS, S⁴G) and Herschel (KINGFISH)

- **Implication is that the base sample POGS pixel SED fitting will likely be at ~ 6" FWHM resolution**

- However, images at full resolution will be served to archive users

- **Subset of POGS bands**

- PSI data only - attempt constraint of limited parameter set
- 5x resolution improvement --- dramatically more galaxies become practical

1'x1'
FOV

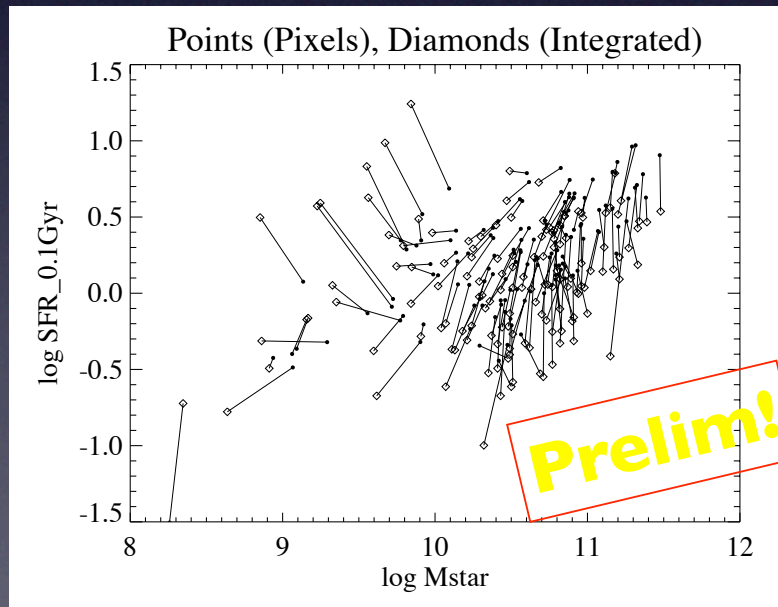

Performance tests

- MAGPHYS assumes closed box scenario / no radiation transfer to surroundings

- Test 1 - Integrated fit versus sum(resolved pixels) **significant changes & trends!**

- Test 2 - Ladder of resolution choices for inter-comparison

- Test 3 - Wavelength coverage biases

About theSkyNet POGS - the PS1 Optical Galaxy Survey

theSkyNet POGS is a research project that uses Internet-connected computers to do research in astronomy. We will combine the spectral coverage of GALEX, Pan-STARRS1, and WISE to generate a multi-wavelength UV-optical-NIR galaxy atlas for the nearby Universe. We will measure physical parameters (such as stellar mass surface density, star formation rate surface density, attenuation, and first-order star formation history) on a resolved pixel-by-pixel basis using spectral energy distribution (SED) fitting techniques in a distributed computing mode. You can participate by downloading and running a free program on your computer.

theSkyNet POGS is based at The International Centre for Radio Astronomy Research.

BOINC: compute for science

BOINC is a program that lets you donate your idle computer time to science projects like SETI@home, Climateprediction.net, Rosetta@home, World Community Grid, and many others.

After installing BOINC on your computer, you can connect it to as many of these projects as you like.

You may run this software on a computer only if you own the computer or have the permission of its owner.

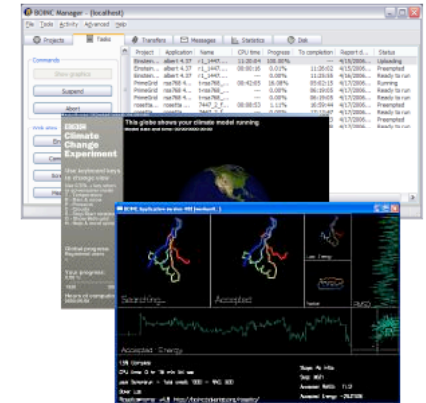

Download BOINC

7.0.31 for Mac OS X (Intel only) (5.93 MB)

After downloading BOINC you must **install** it:

- Save the file to disk.
- Double-click on the file icon.

3.6 μ m, g, NUV

22 μ m, r, NUV

Stamp collection incentive for volunteers -- Galaxy images
with the locations processed by their computer(s) marked
And now the parameter maps are also displayed!

- Example science applications of POGS pixelSED fits
 - Build-up of disks, spheroids / age of bars (JHU)
 - Mass modeling for SFL and rotation curve interpretation (ICRAR)
 - Hierarchical SF - demographics, clustering of young regions (JHU)
 - PAH emission vs. local environmental conditions (12 micron W3)
 - Resolved gas-to-dust analysis (WALLABY@ASKAP + WNSHS)
- Upcoming “crowd sourcing” project extension (a la GalaxyZoo)
 - Galfit to be done on mass map, defining structures - then “colored” using pixelSED models integrated in areas of feature dominance (disk, bulge, bar)
 - Interactive vetting of multi-wavelength galfit models against color imaging

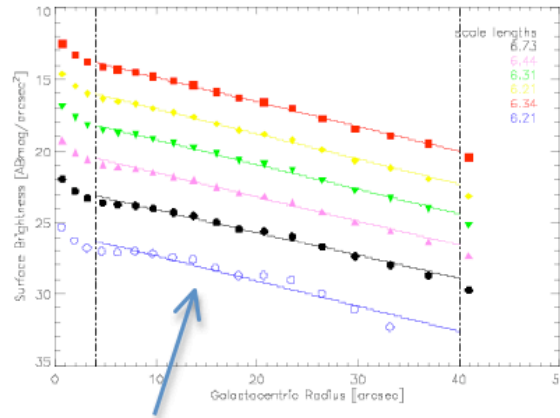

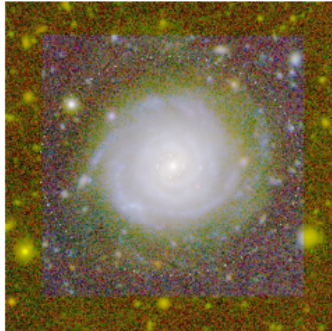

- **Tully, Meurer, Tonry** and collaborators:
 - **A Catalog of Galaxy Distances using the T-F relation**
 - Uniform, deep photometry for nearby galaxies, coupled with rotation curve information
 - 3π completion + sky background restoration essential
 - **Image stacking** analysis (proposed by **A. Ferguson + S. Zibetti**)
 - color and luminosity measurement of stellar halos
 - link halo to galaxy properties
 - outer disk profiles

Pan-STARRS

Zheng+, PSI MDS disk mass profiles

Durham
9 Jan 2013

Stellar mass manifests differently from SB because different star formation history and dust attenuation changes the 'mass-to-light ratio'.

Stellar mass radial profiles also have 3 types, consistent with PT06, but up-bending profiles are more often than PT06.

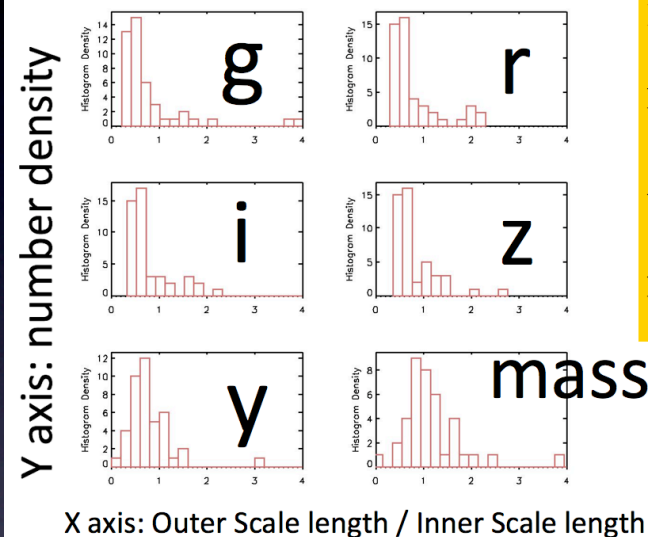

Star formation radial profiles is more likely to turn down comparing to the stellar mass profiles.

The outer disk seems more likely to be dominantly formed by stellar migration. Presence or lack of XUV-disk SF is not adequately addressed by these data.

We are planning to study for trends in the ancillary profiles in relation to the position of the mass breaks.

In the future, we also plan to use the PSI 3pi data, this will bring in many more galaxies and also allow incorporation of GALEX data.

(outer-inner) disk scale length ratio

Redder bands and stellar mass radial profiles tend to 'turn up' in the outer disks. Whilst bluer bands and star formation radial profiles tend to 'turn down'.

- **“Pan-Squared Project” (lead: Heckman)**
 - mine PS1 imaging of SDSS main galaxy sample
 - many aspects now incorporated into POGS
- **“Pan-STARRS High-Redshift Galaxies Project” (H. Ferguson)**
 - distr. of (M , SFR , morphology | z_{phot})
 - PS1 MDS focused
 - blends with KPI2 -- some results already shown here
 - distinction between KPs presumably unnecessary
- **KP5 -- MW hot white dwarf census (Bianchi, Long, Thilker)**
 - GALEX-PS1 stellar matched catalog -- color selection
 - IFMR constrain by comparing counts to MW models

David Thilker
Johns Hopkins

Pan-STARRS
PS1 Science Consortium

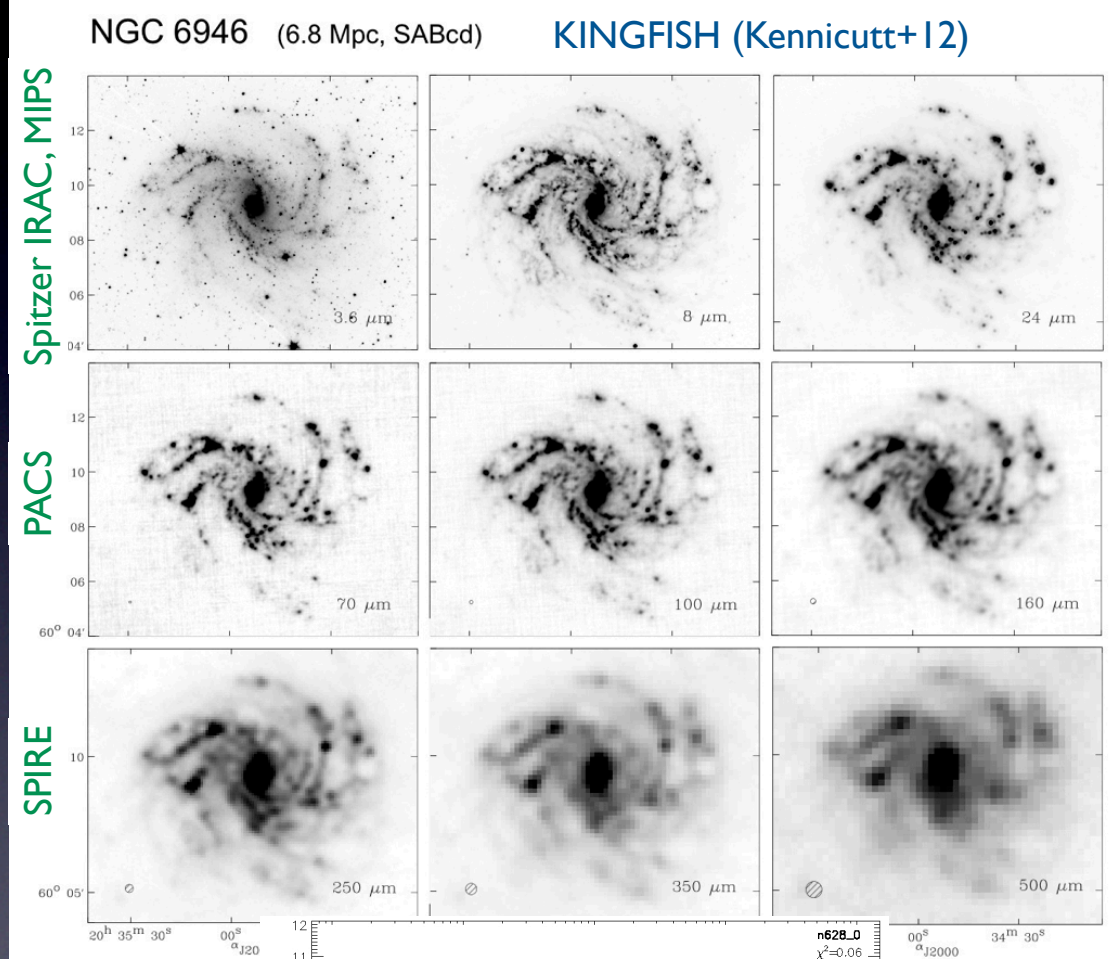

Durham
9 Jan 2013

- Backup slides

- **Robustness tests using Alpha version results**
 - Add full set of input SFH model parameters to output! (NOW DONE)
 - Solution degeneracy concerns (IN PROGRESS)
 - output 2D probability distribution functions for key parameters
 - “n” best fit solutions - corresponding to different χ^2 minima in param. space
 - Long wavelength dependence (PREPPING DATA)
 - Limited subset of bands
 - Physical scale lower limit
 - Adaptive smoothing or PCA-based smoothing (to IMPLEMENT)
- **Initial suite of papers coming ... participation welcome!**

- POGS SED coverage will end at 22 microns (WISE W4 band) leaving dust model params largely unconstrained
- How accurate are stellar parameters determined in this limit?
- Use Herschel (KINGFISH) data to check empirically
