Jackson+ (in prep.)

AGN feedback affects the width of the SFR-mass relationship in galaxies.

T = 1000 Myr

**Only 5% of the AGN's  
radiative power  
is used to thermalise the gas  
in this simulation**

**$\epsilon_r = 0.05$**

Di Matteo+ (2005)

10 kpc/h

Radiative energy absorbed in the galaxy  
over the AGN's lifetime

$$E_{\text{rad}} \approx \epsilon_r L_{\text{bol}} t_{\text{AGN}}$$

A wind with  
terminal speed  $V_w$   
travels from the nucleus to  
 $\text{Dist} = V_w \times t_{\text{AGN}}$   
over the AGN's lifetime

If:  $V_w = 1000 \text{ km/s}$   
and  
 $t_{\text{AGN}} = 1 \text{ Myr}$   
then  
 $\text{Dist} = 1 \text{ kpc}$

# Central Stellar Masses

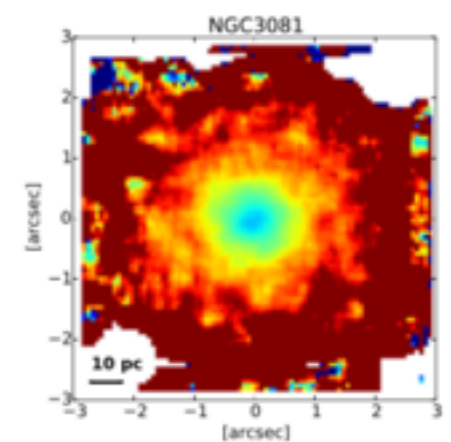

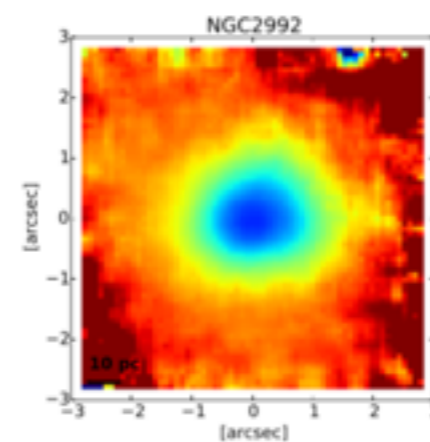

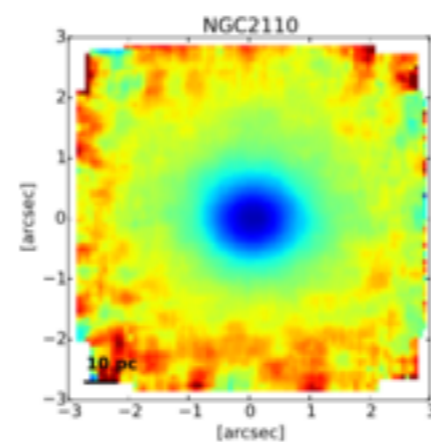

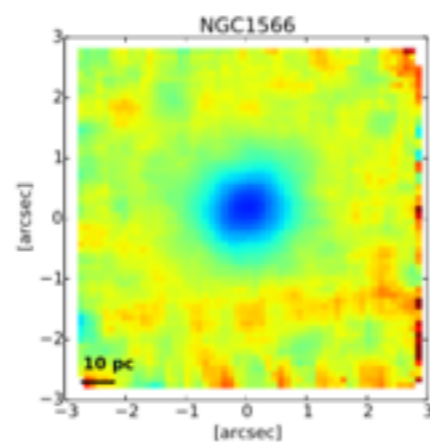

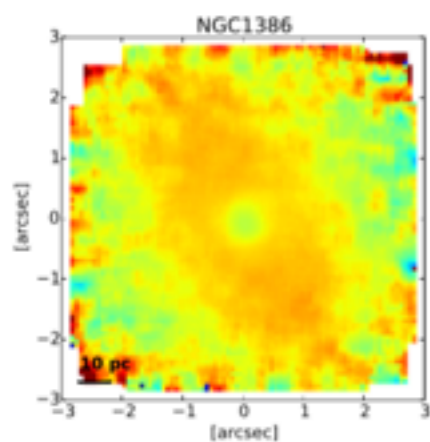

## The stellar mass over the CO beam

This is not trivial for AGN. But IFU data exists for all our galaxies, so we use the dilution of the CO bandhead

Examples of LLAMA AGN with central CO bandhead dilution due to nuclear emission

Burtscher+ (2015)

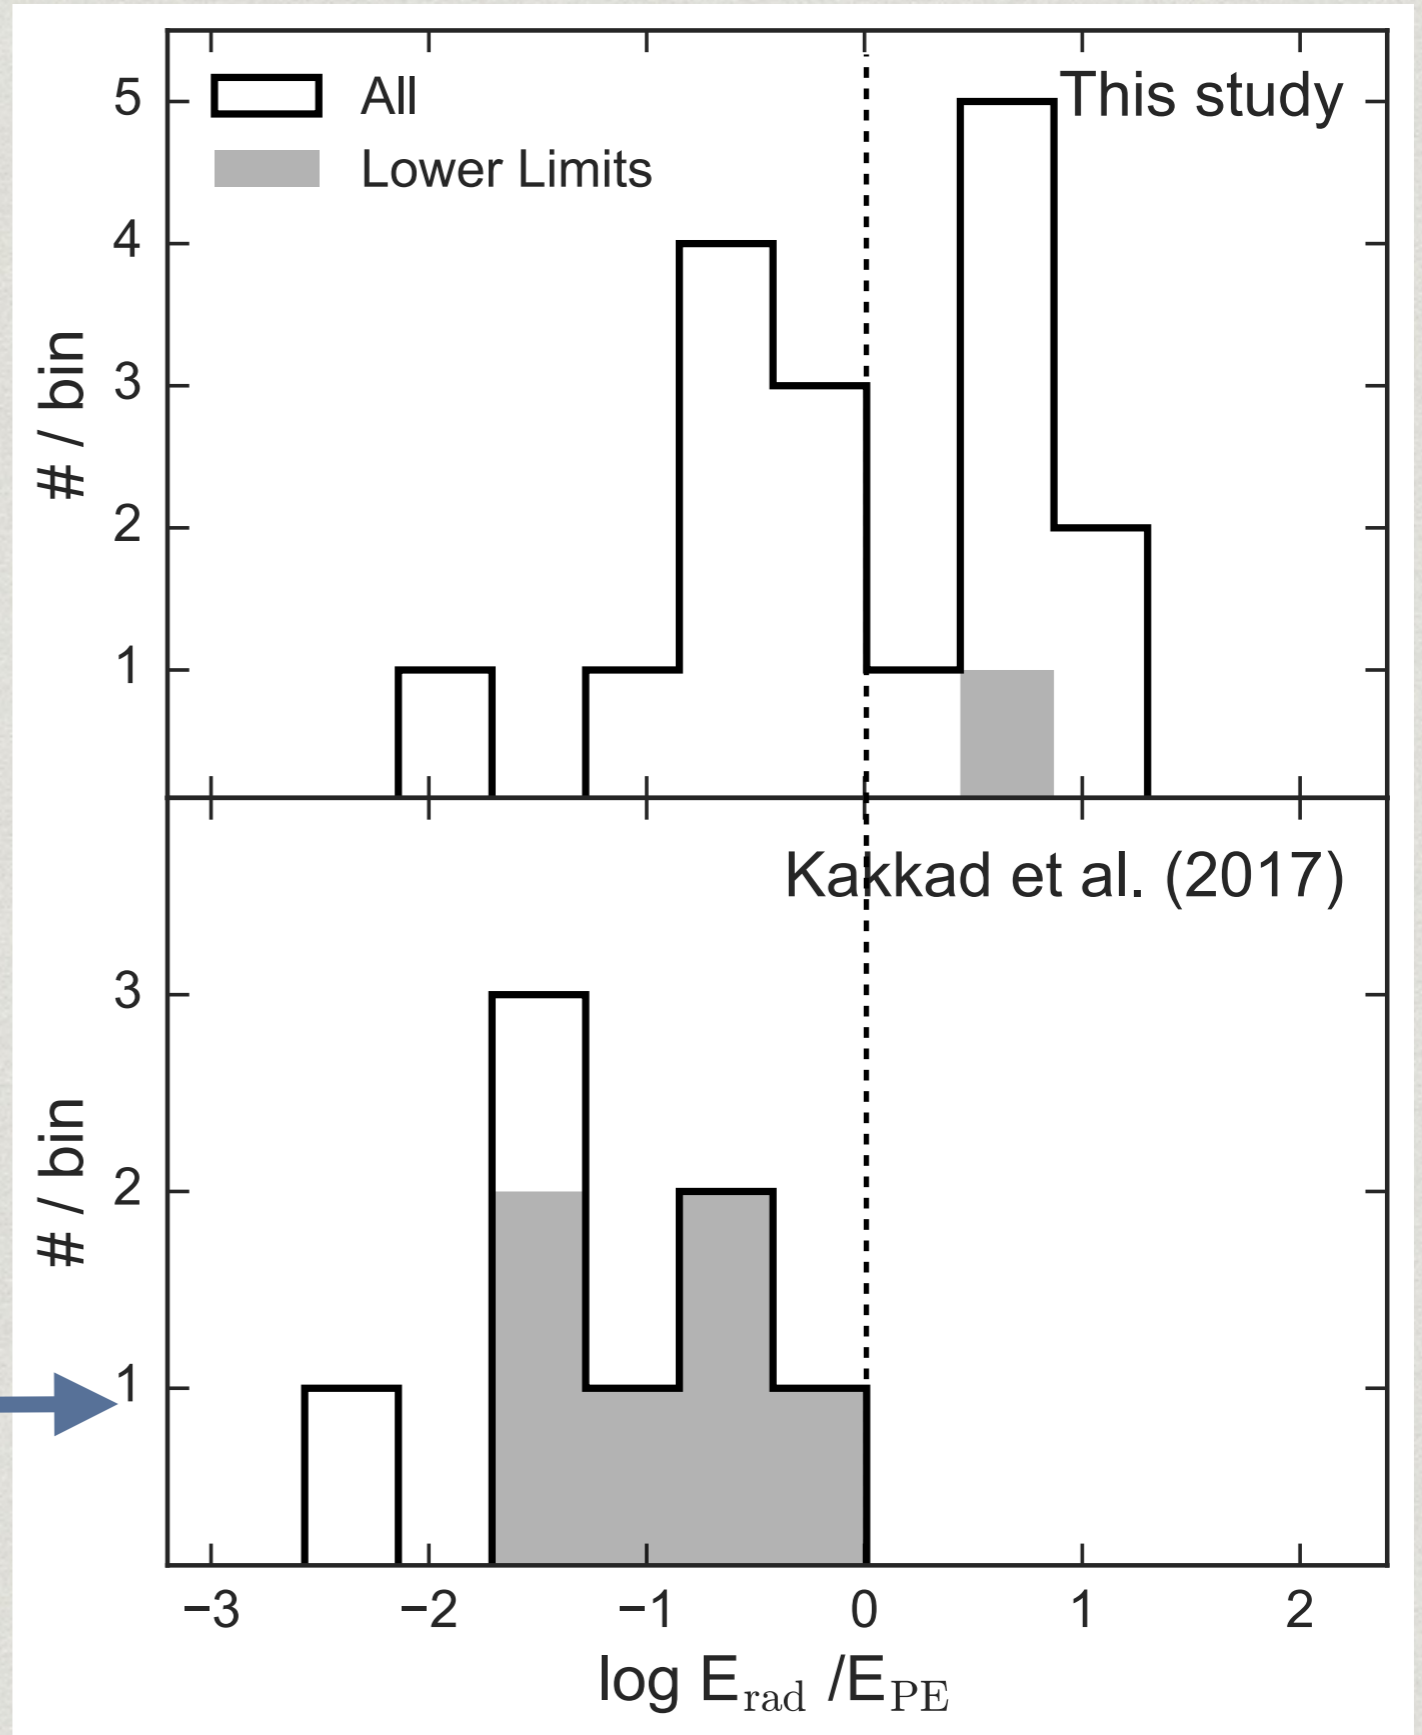

- a)  $L_x \rightarrow L_{bol}$
- b) NIR flux  $\rightarrow M_\star$
- c) CO luminosity  $\rightarrow M_{H_2}$
- d)  $R_{beam} = \text{CO beamsize}$
- e)  $\epsilon_r = 5\%$

$$E_{rad} \approx \epsilon_r L_{bol} t_{AGN}$$

$$E_{PE} \approx -\frac{GM_\star M_{H_2}}{\eta R_{beam}} (1 + f_{gas})$$

Similar analysis  
for AGN at  $z \sim 1.5$   
with ALMA CO  
observations

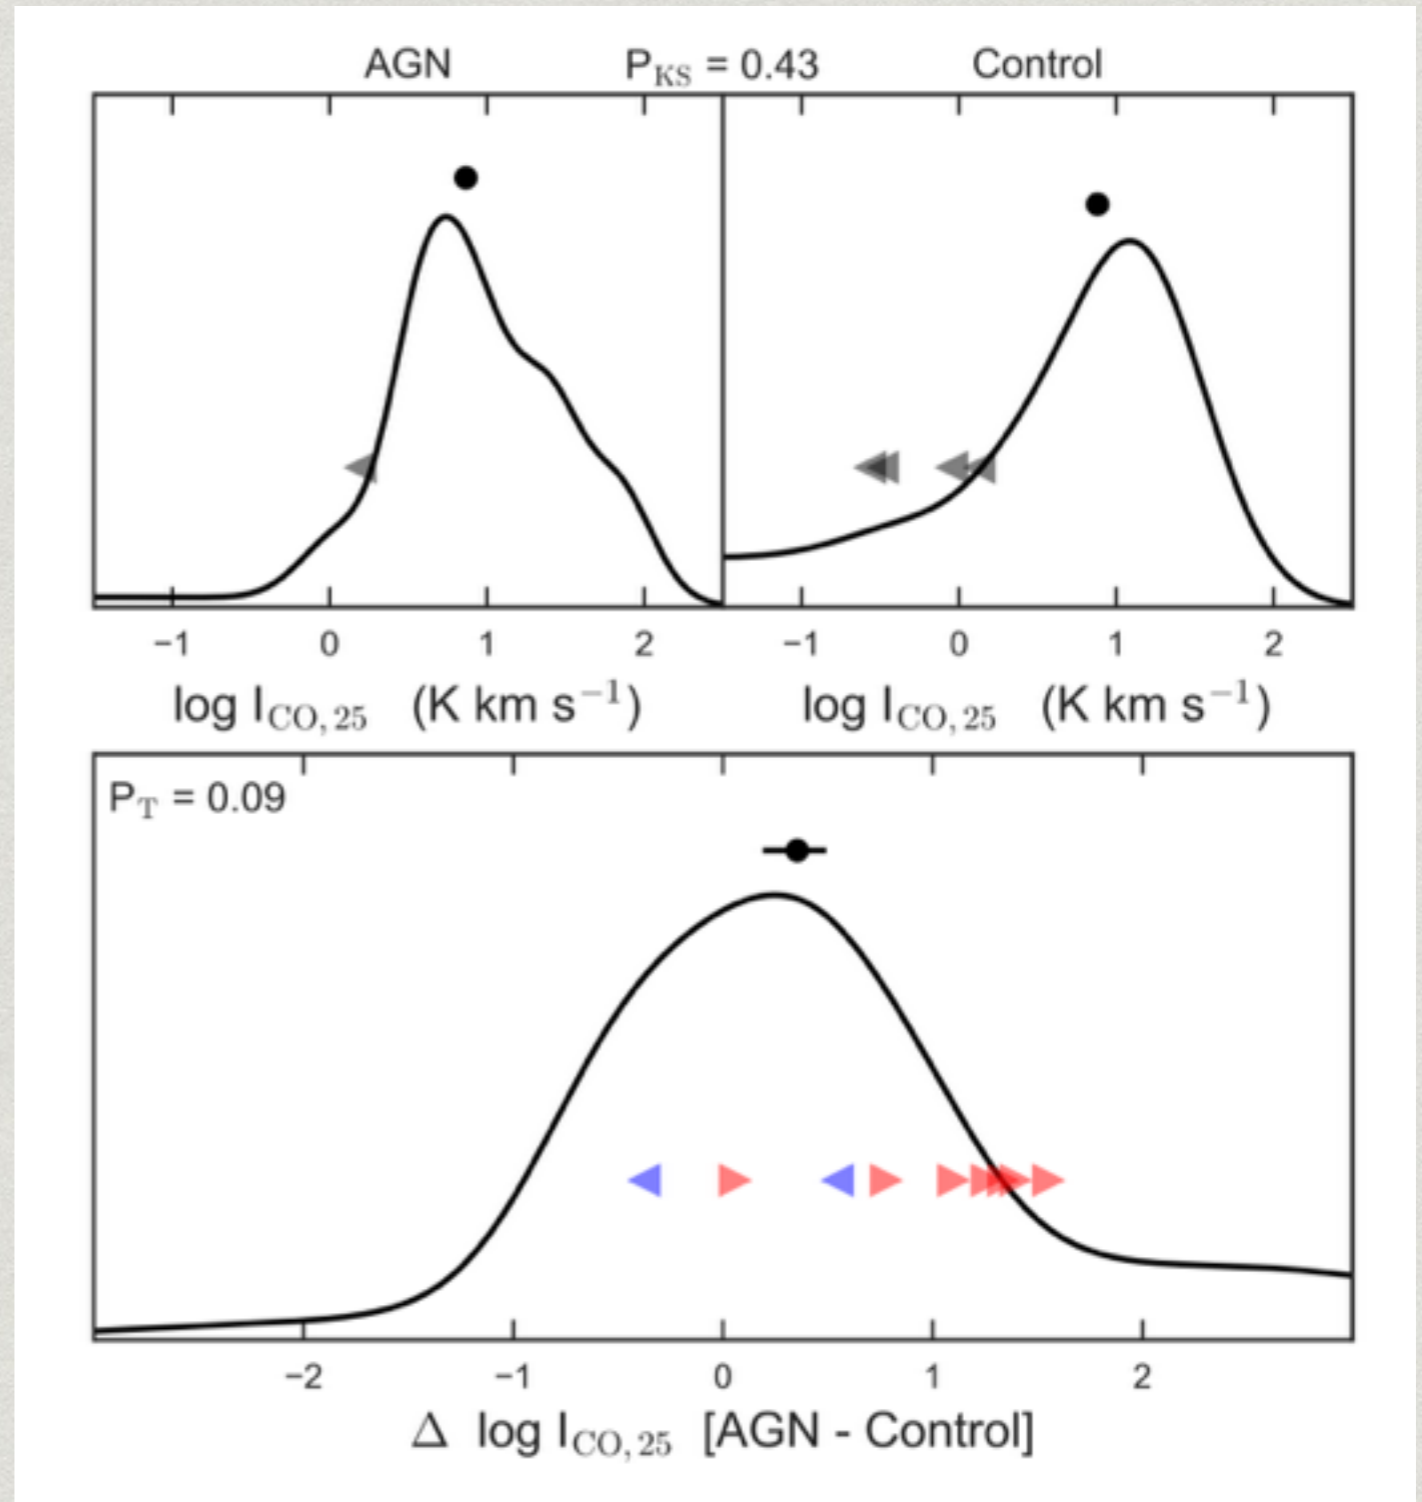

Among half of the LLAMA AGN, there is enough nuclear power to potentially destroy molecular gas on kpc scales.

The physics uncovered in nearby Seyferts is relevant for AGN feedback on molecular gas at high redshift.

CO intensity  $\propto$  molecular gas mass

Individual distributions for both types of galaxy

Distributions of the difference with all control pairs considered together

If we can measure  
the molecular gas mass in the central kiloparsecs,  
we can examine:

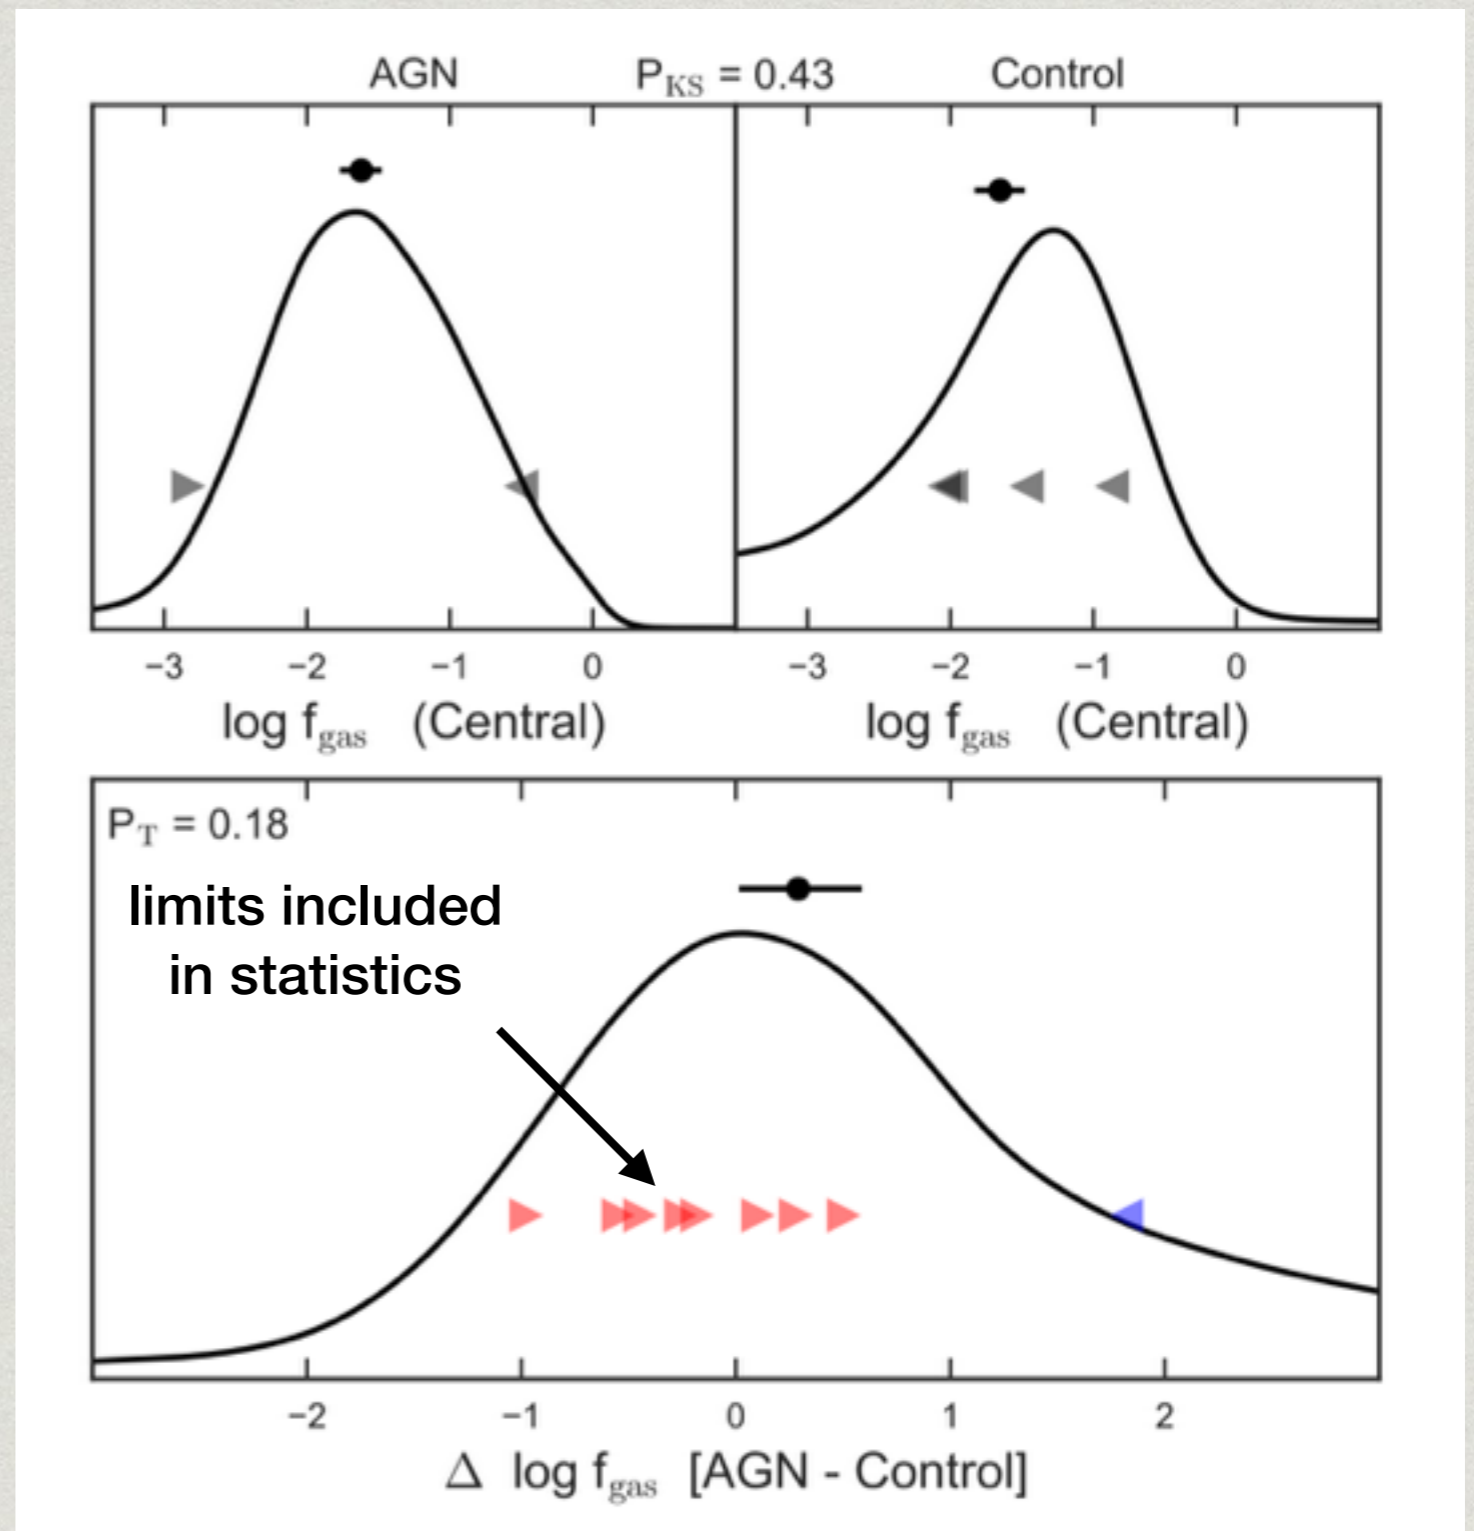

The molecular gas fraction ( $f_{\text{gas}}$ )

If AGN destroy or drive away molecular gas,  
 $f_{\text{gas}}$  will drop.

# Molecular gas fractions

We adopt  $\alpha_{\text{CO}} = 1.5$  lower than the Milky Way, but consistent with the centres of nearby galaxies (Sandstrom+ 2013)

If we can measure  
the molecular gas mass in the central kiloparsecs,  
we can examine:

The star formation efficiency ( $\text{SFR} / M_{\text{H}_2}$ )

If AGN destabilise molecular clouds, this  
efficiency will drop (negative feedback)  
or rise (positive feedback).

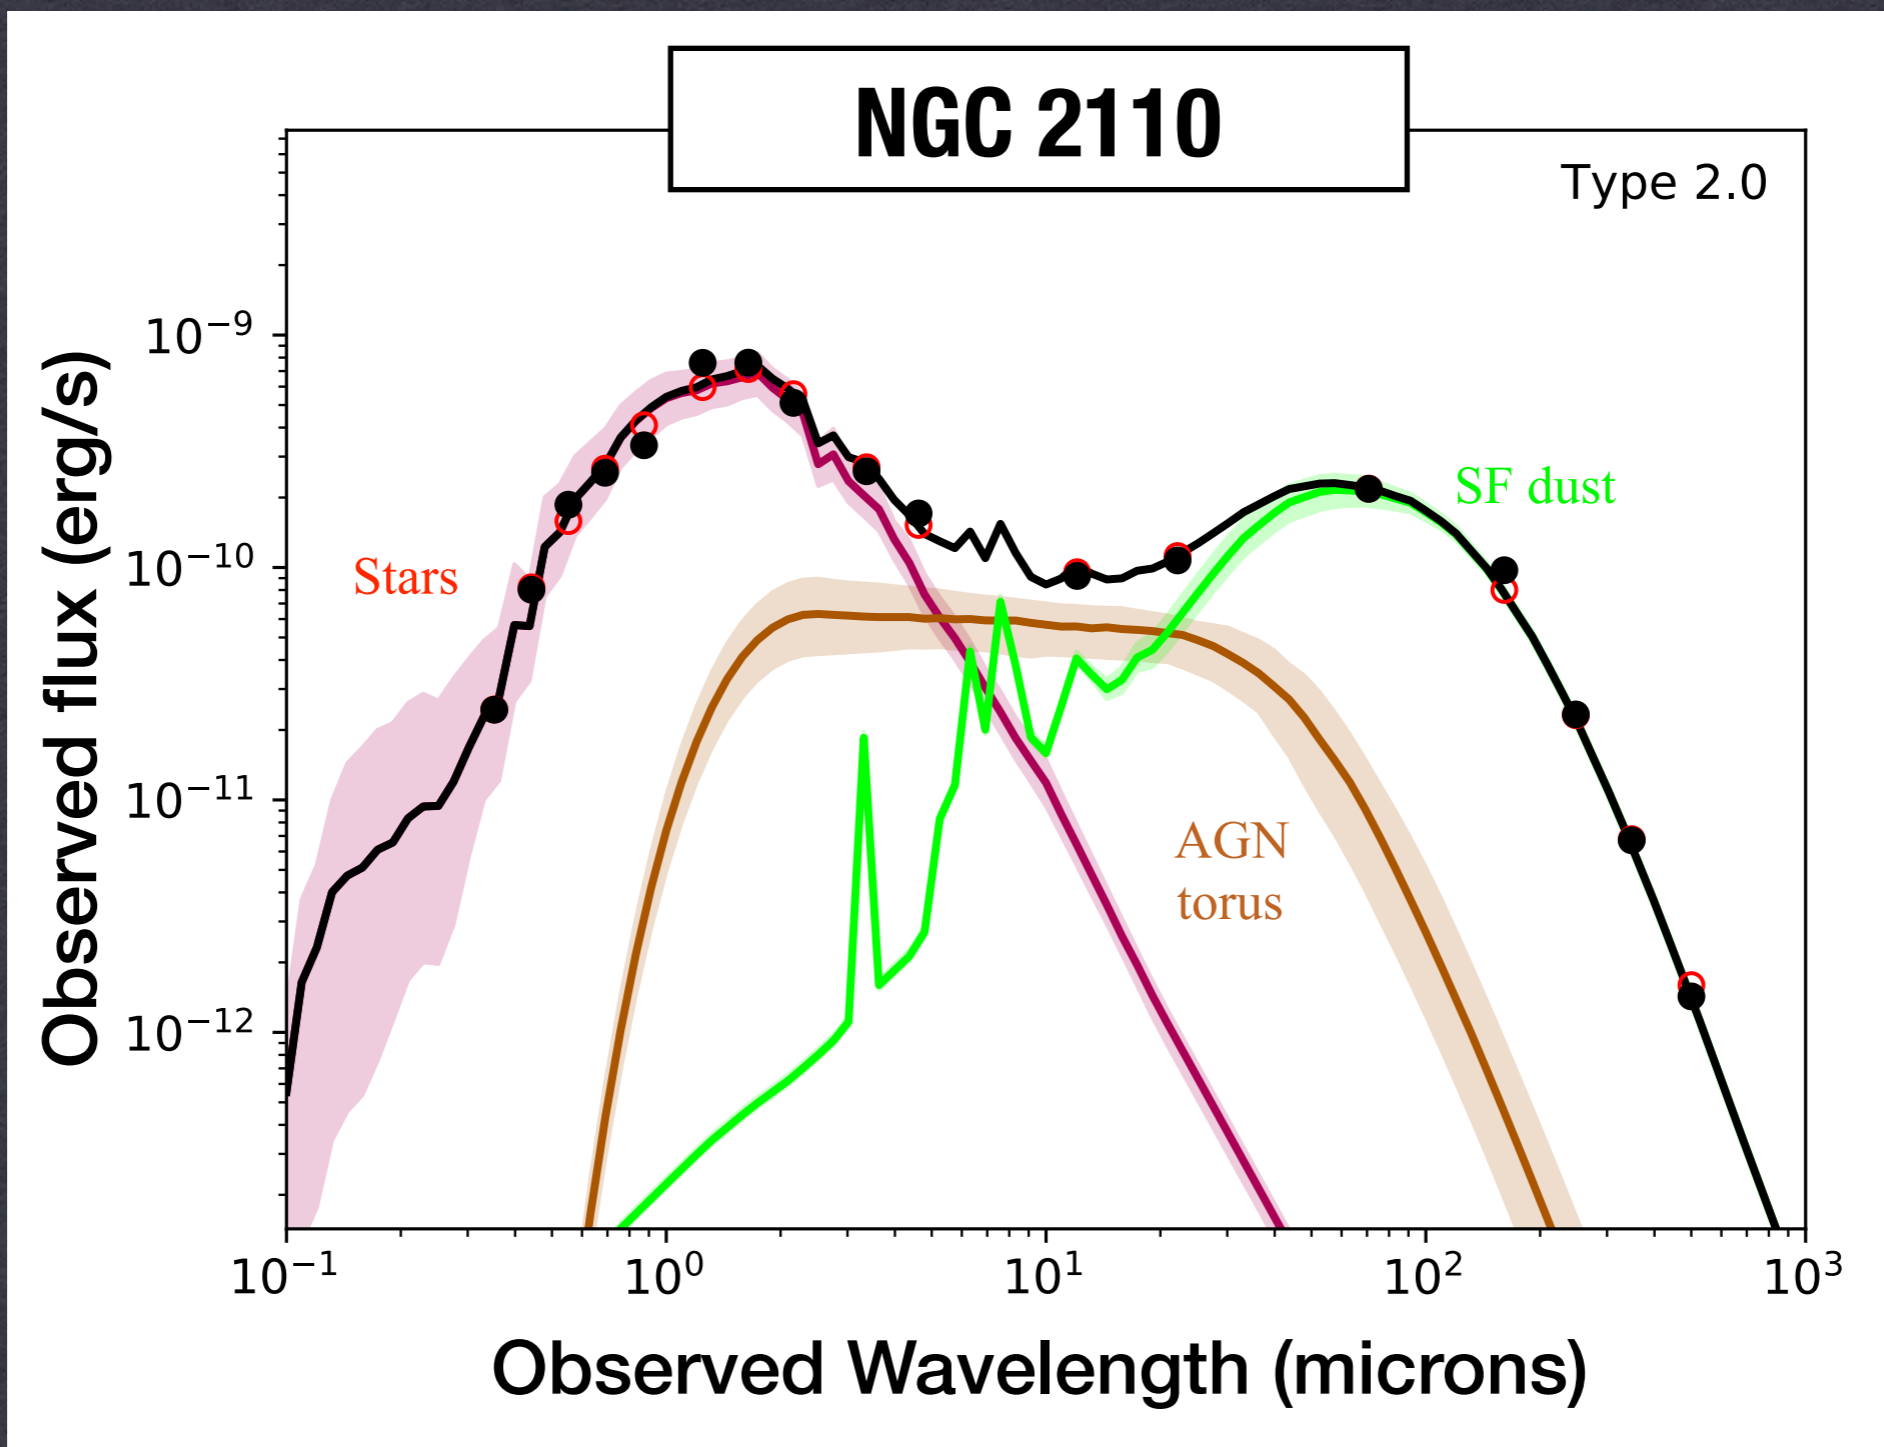

But we need the SFR over the CO beam.

# Central Star Formation Rates

FIR-based SFRs scaled to match the CO telescope beam.

A robust treatment of all uncertainties, including systematics of SFR calibrations, CO conversion factors, AGN contamination.

# The star-formation efficiency of the central molecular gas

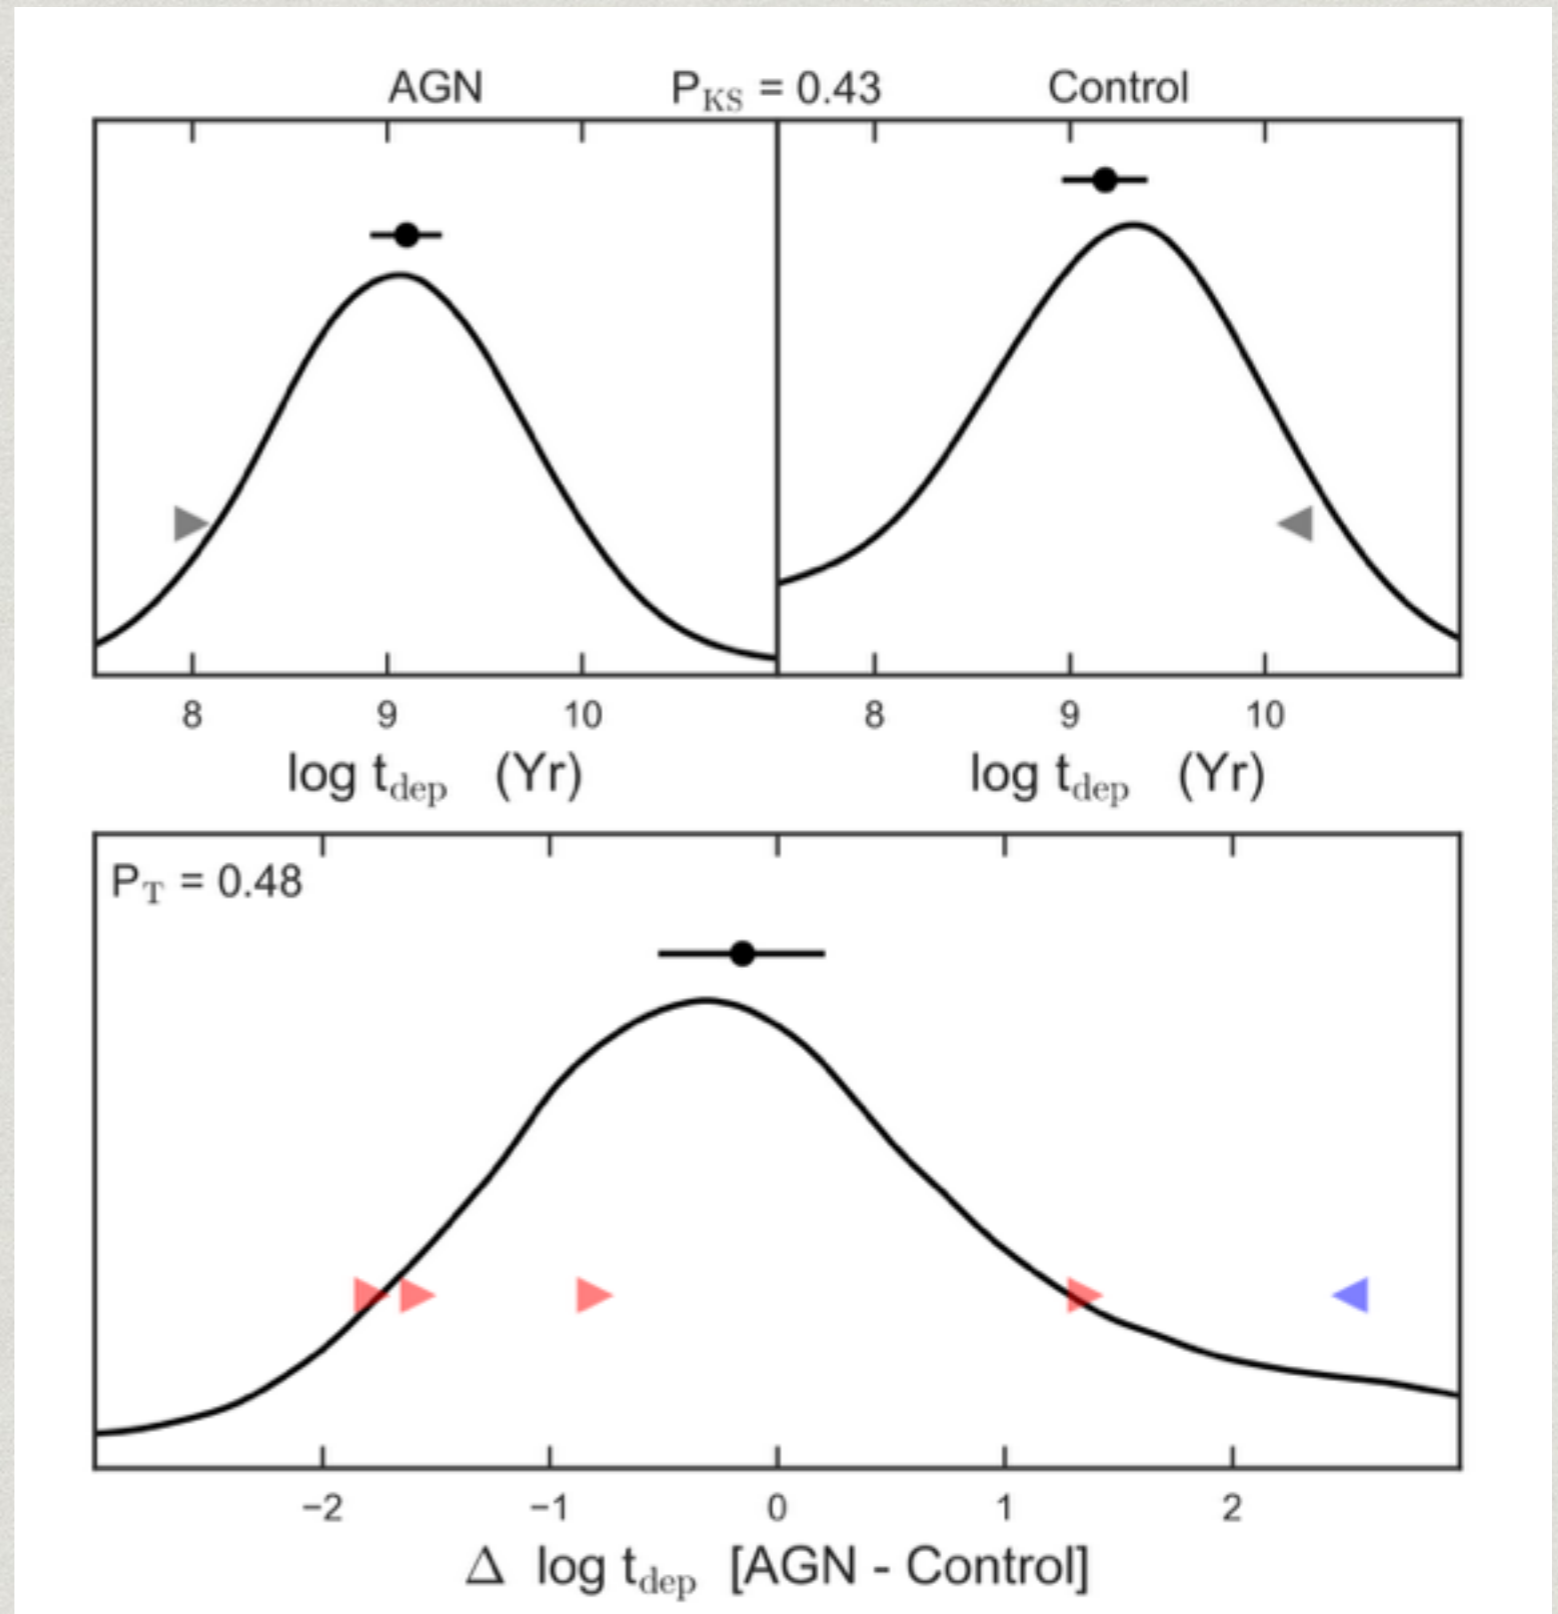

# Molecular gas “depletion times”

The inverse of the star formation efficiency.

No statistical difference between AGN and control galaxies.

# SUMMARY

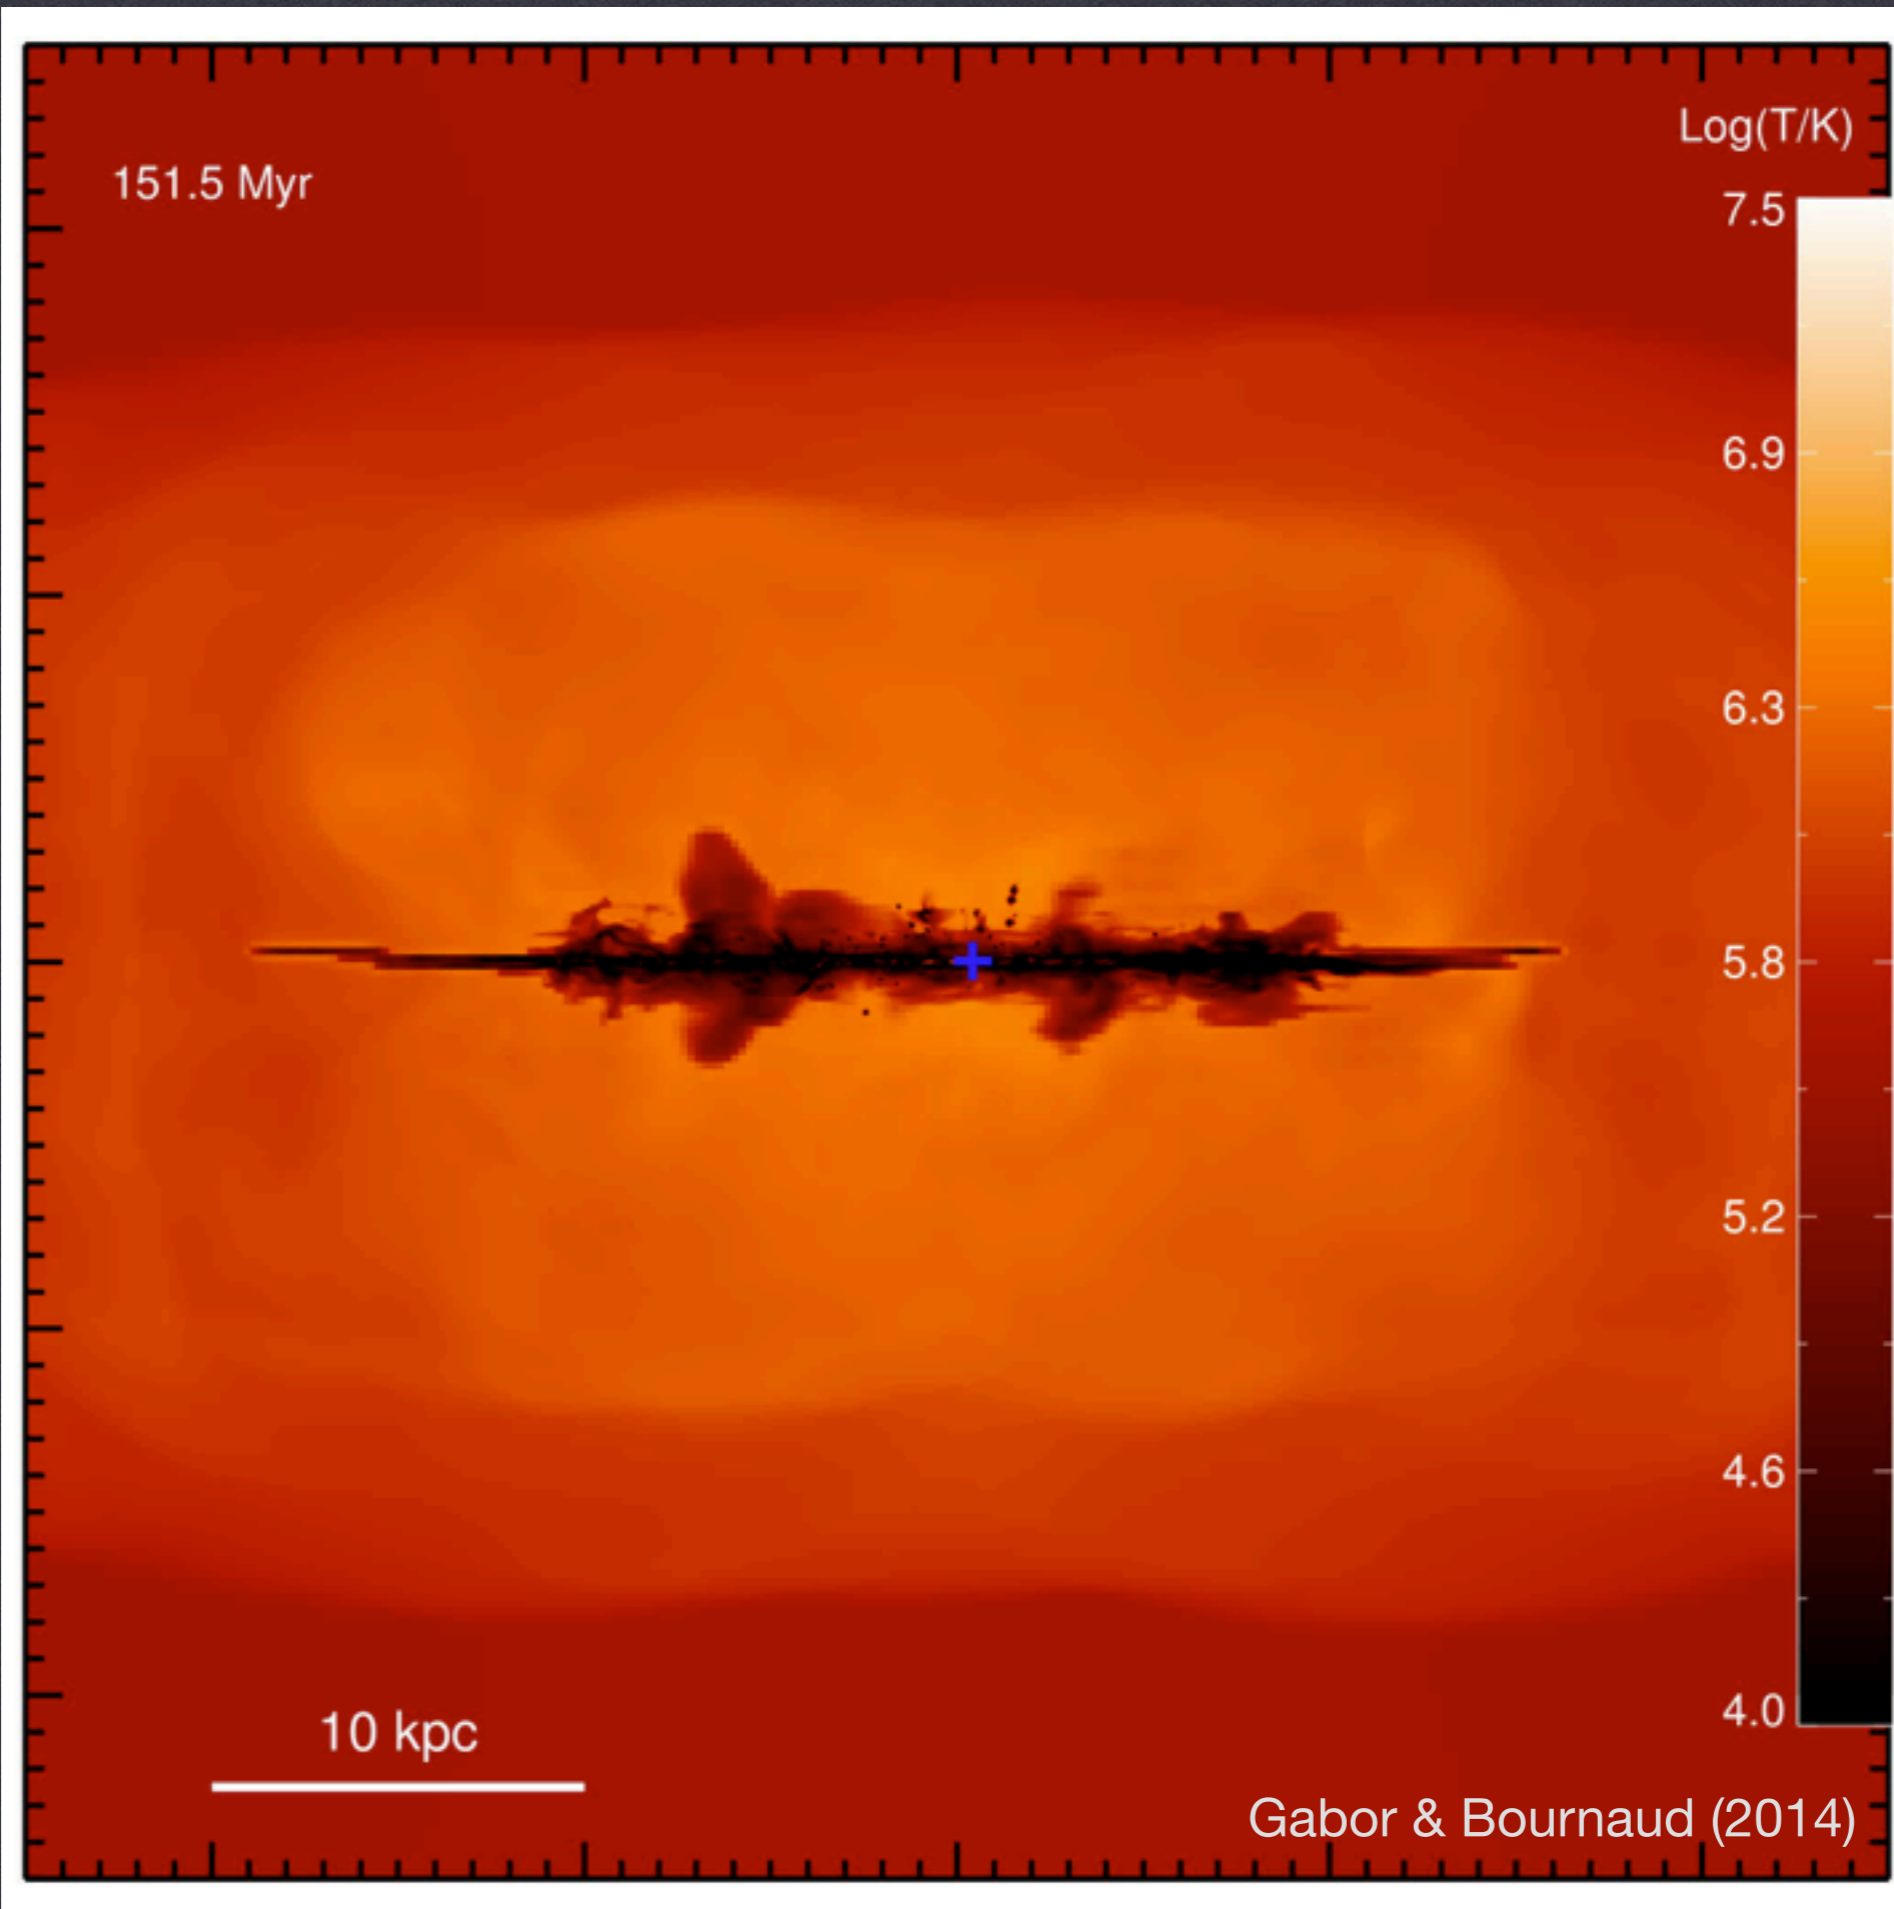

The central molecular gas fractions and central star-formation efficiencies of local bright Seyferts are statistically indistinguishable from similar inactive galaxies.

But these Seyferts are energetic enough to destroy a substantial part of this molecular gas.

We conclude: the coupling of an AGN's luminosity to the star-forming material in its vicinity is not as strong as models demand.

Dusty gas

# CONCLUSIONS / THOUGHTS

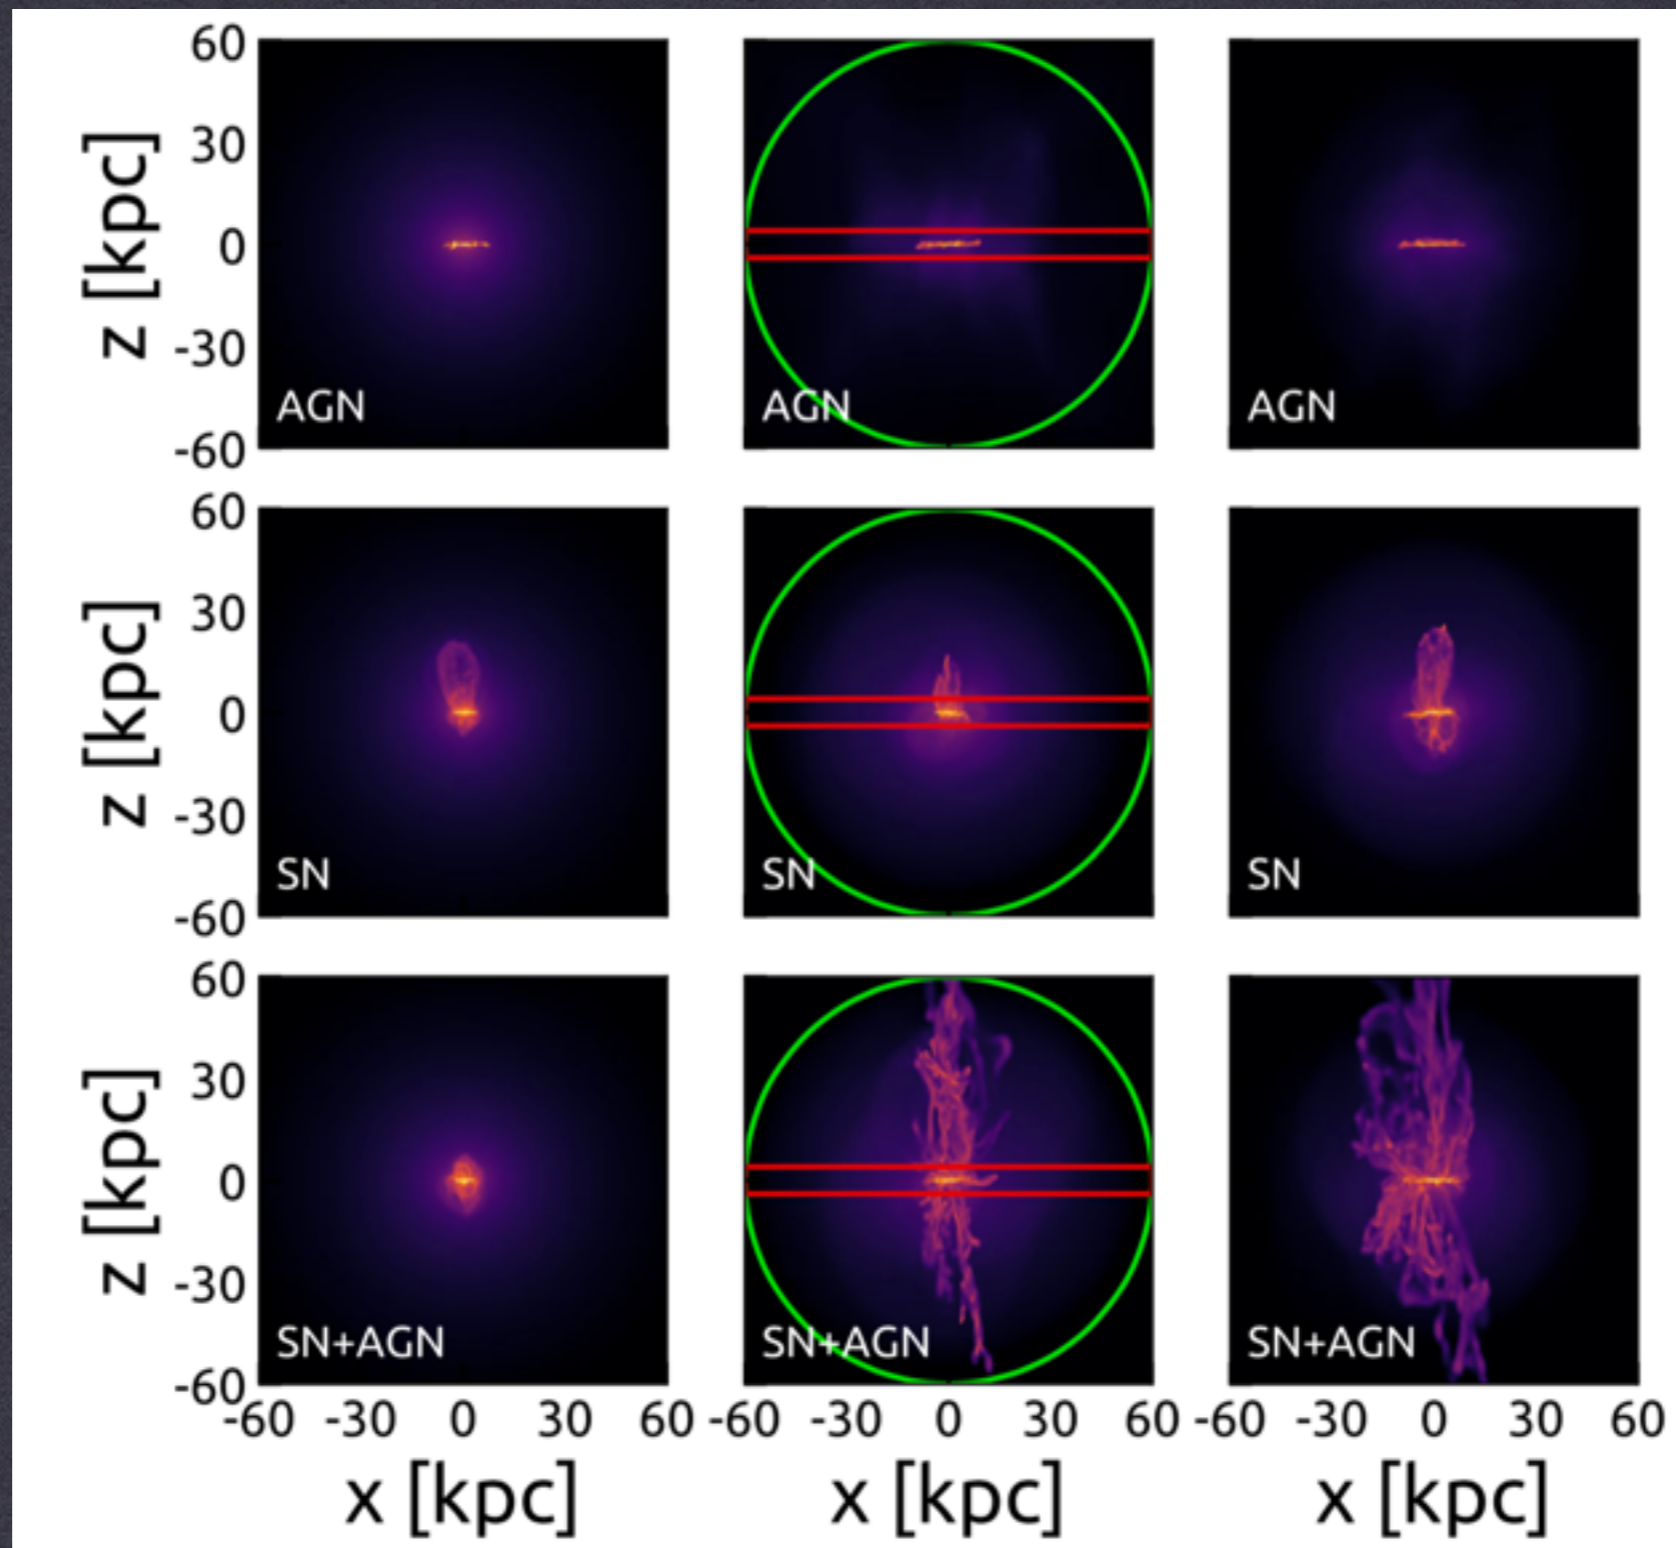

AGN do not summarily destroy dense, star-forming gas. Most of their feedback energy is probably carried away by a hot and ionised phase, with low coupling to molecular gas.

AGN can heat molecular gas, temporarily changing its properties, but the gas remains intact.

This is still enough to cut-off long term accretion of cold gas into galaxies. The role of AGN feedback in galaxy evolution is mostly to restrict supply.

# Does star-formation promote AGN feedback?

# FortesFit

[github.com/vikalibrate/FortesFit](https://github.com/vikalibrate/FortesFit); Rosario+ (in prep.)

FortesFit addresses these issues with:

- ✓ A general approach to painlessly add any parameterised SED model, and combine them in the fit.
- ✓ A full treatment of continuous, informative priors, including SciPy stats distributions.
- ✓ Functionality for hyperpriors (“dependencies”).
- ✓ Out of the box MCMC and the capability to add other fitting engines with minor development.

Code has been put into public domain, has been used in a published paper, and is in development for use with the KASHz and BASS programs.

Looking for co-developers, testers, users.
