Outline

- ISW from stacking of super-structures
- Results from SDSS-DR6-LRG super-structures
- Comparison with simulations
- Results from SDSS-DR7 voids
- Summary

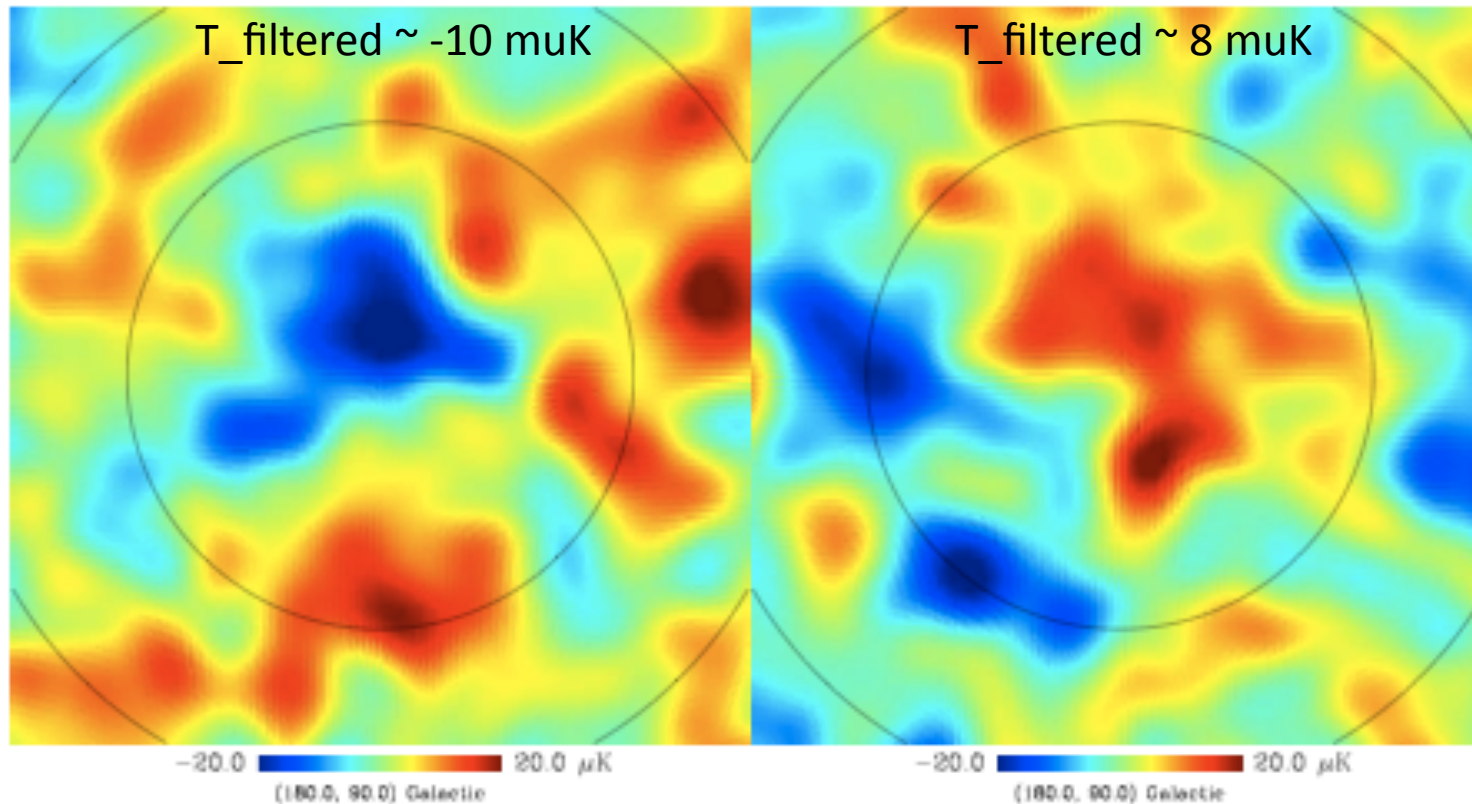

50 super voids/clusters (ZOBOV/VOBOZ) from SDSS DR6, LRG
Mega-Z catalogue, $z \sim 0.4-0.75$

Granett et al. 2008

Stacking of voids/clusters

cold spot surrounded by hot ring

hot spot surrounded by cold ring

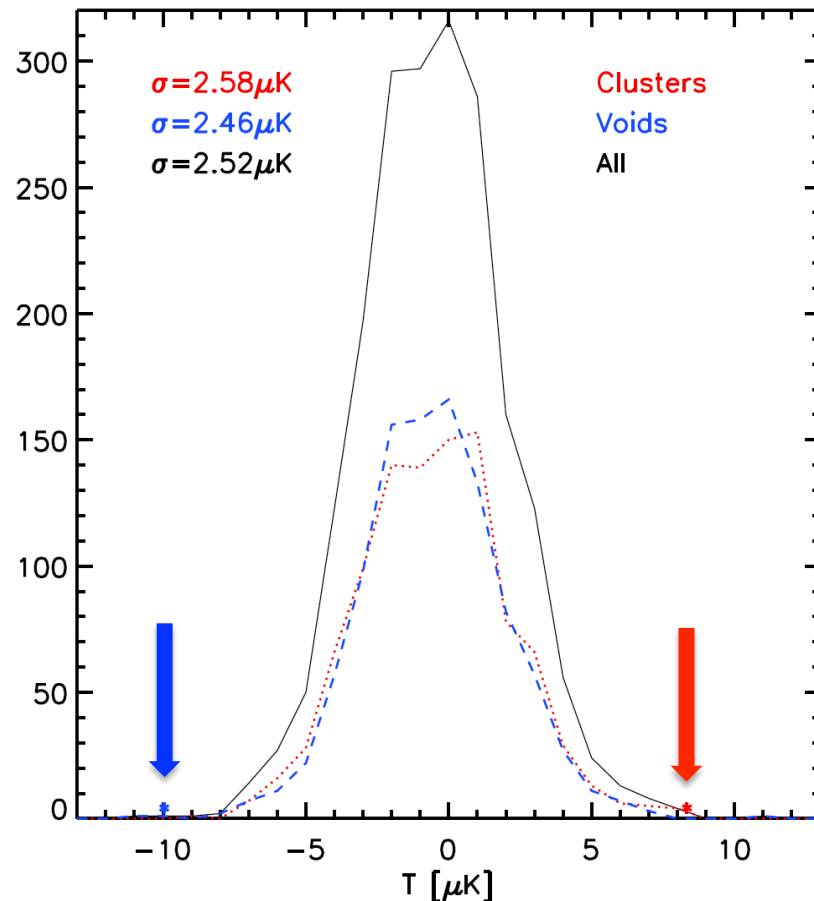

Stacked CMB temperature from WMAP5 V-band, using
50 voids and 50 clusters positions from SDSS galaxy

Weak frequency dependence

Reproducing Granett et al. 2008

4-sigma detection of ISW, a problem?

If ISW, the amplitude ($\sim 10 \mu\text{K}$) is too high compared to LCDM expectation (3-sigma?), e.g.

Granett et al. (2008), Papai et al. (2011), Nadathur et al. (2012), Flender et al. (2013), Hernandez-Montenegro & Smith (2013)

The same stacking on the reconstructed ISW map from galaxy density field find no signal
Granett et al. (2009)

a tension? what's missing?

Stacked CMB temperature, filtered by compensated filter of 4-deg radius, $R \sim 100 \text{ Mpc}/h$ at $z \sim 0.5$

Power spectra of $\dot{\Phi}$

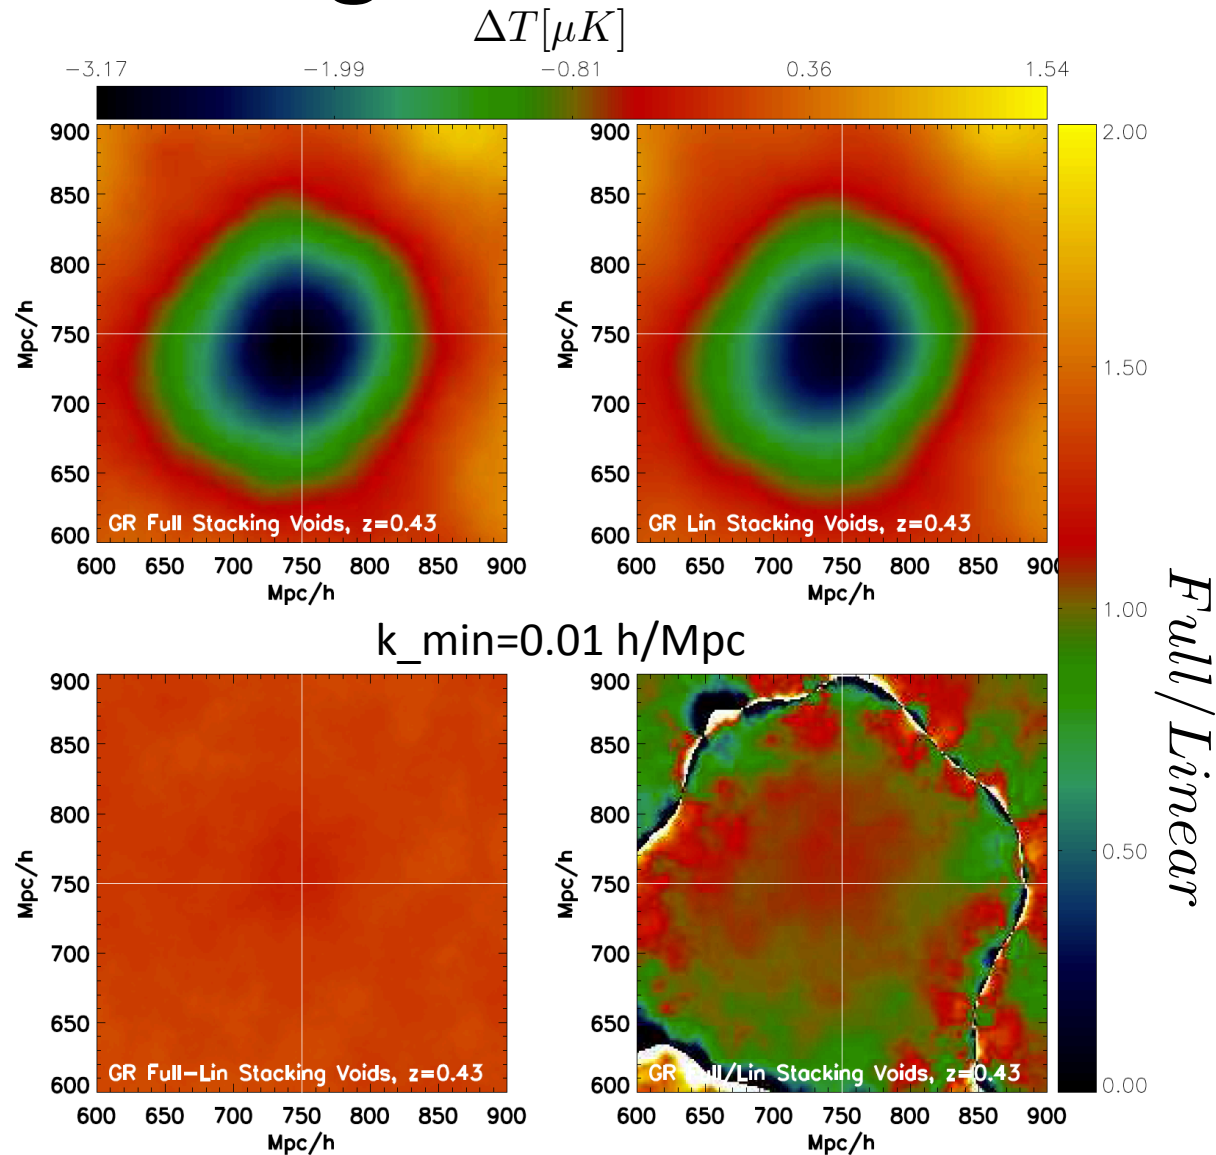

Deviation from linear theory occurs on larger scales at higher redshift.

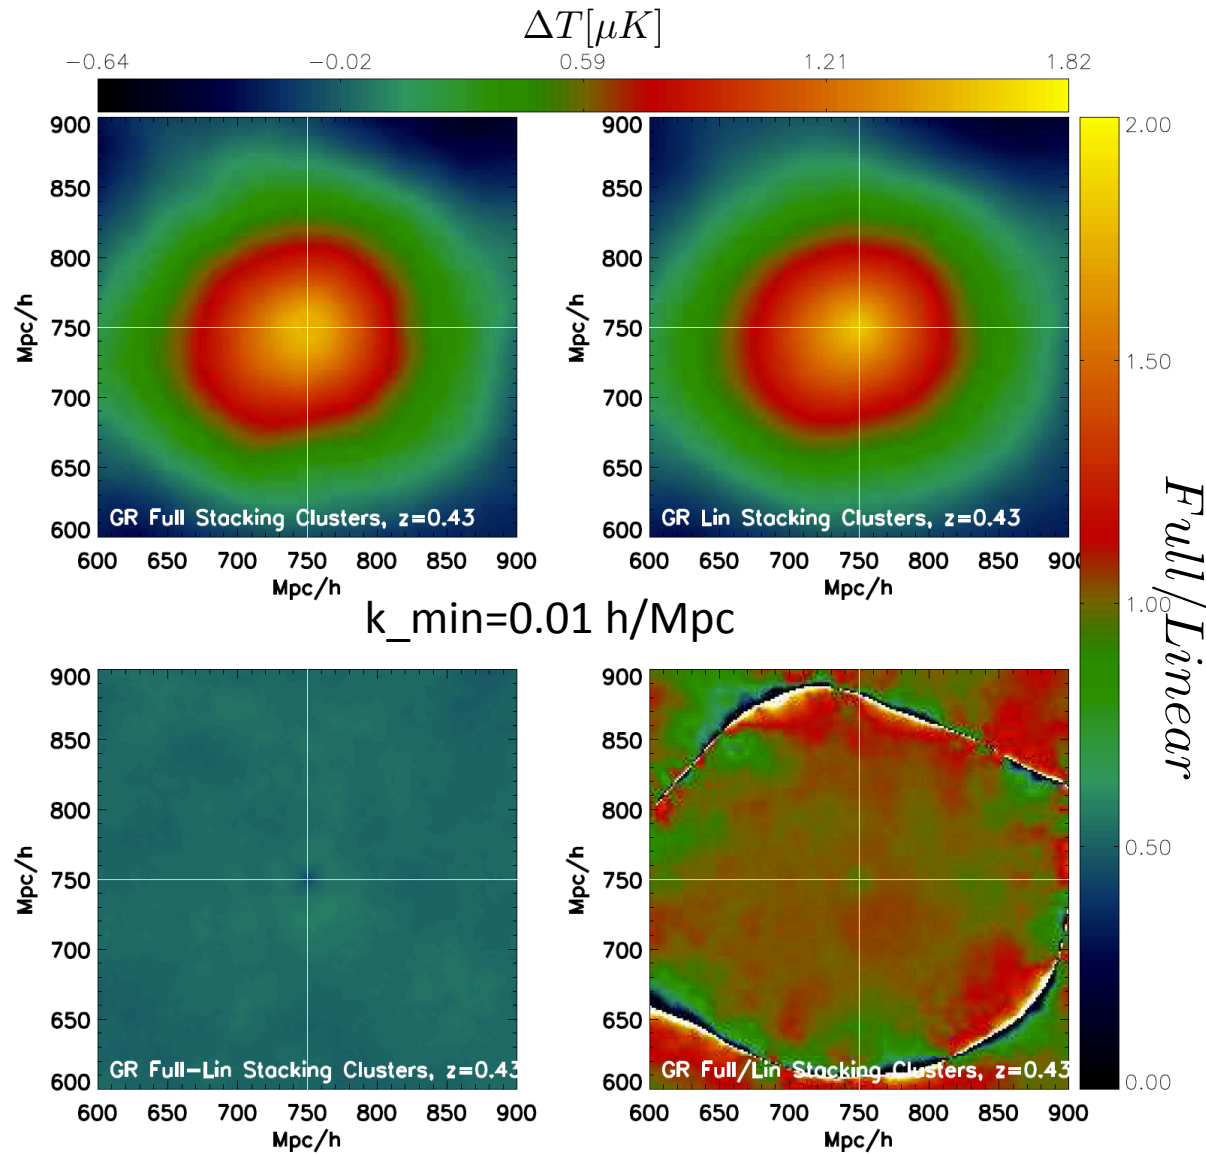

Filters with sharp feature may pick up large difference

$$\mathcal{P}_{\dot{\Phi}\dot{\Phi}}(k, z) \equiv P_{\delta\delta}(k, z) - 2\frac{P_{\delta\delta'}(k, z)}{H(z)} + \frac{P_{\delta'\delta'}(k, z)}{H(z)^2}$$

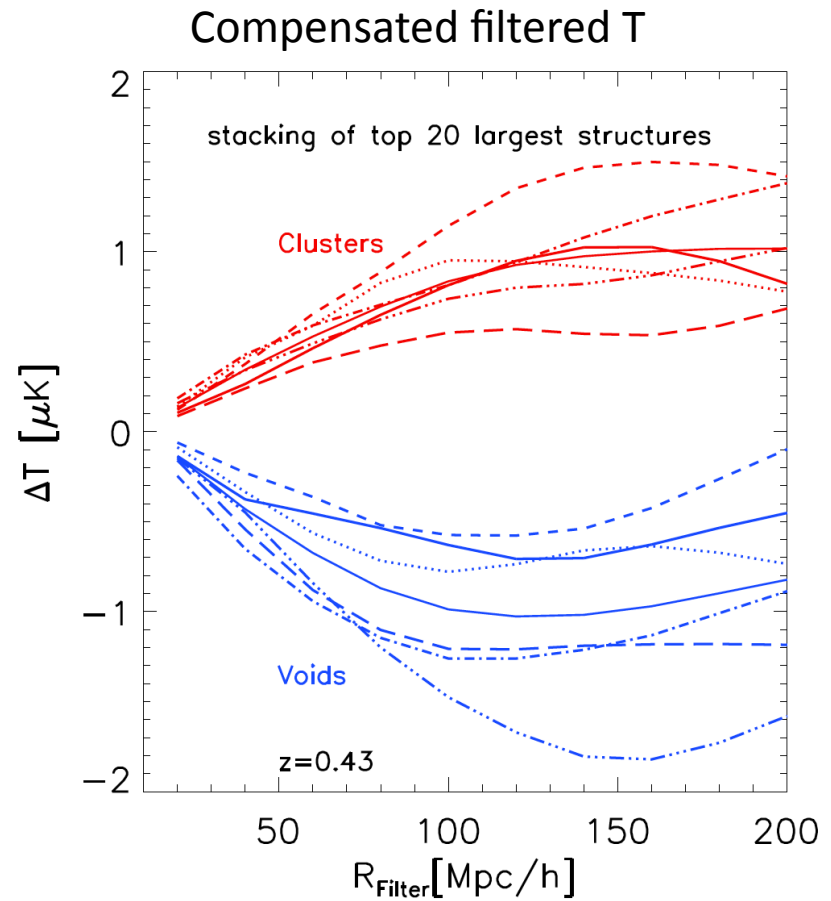

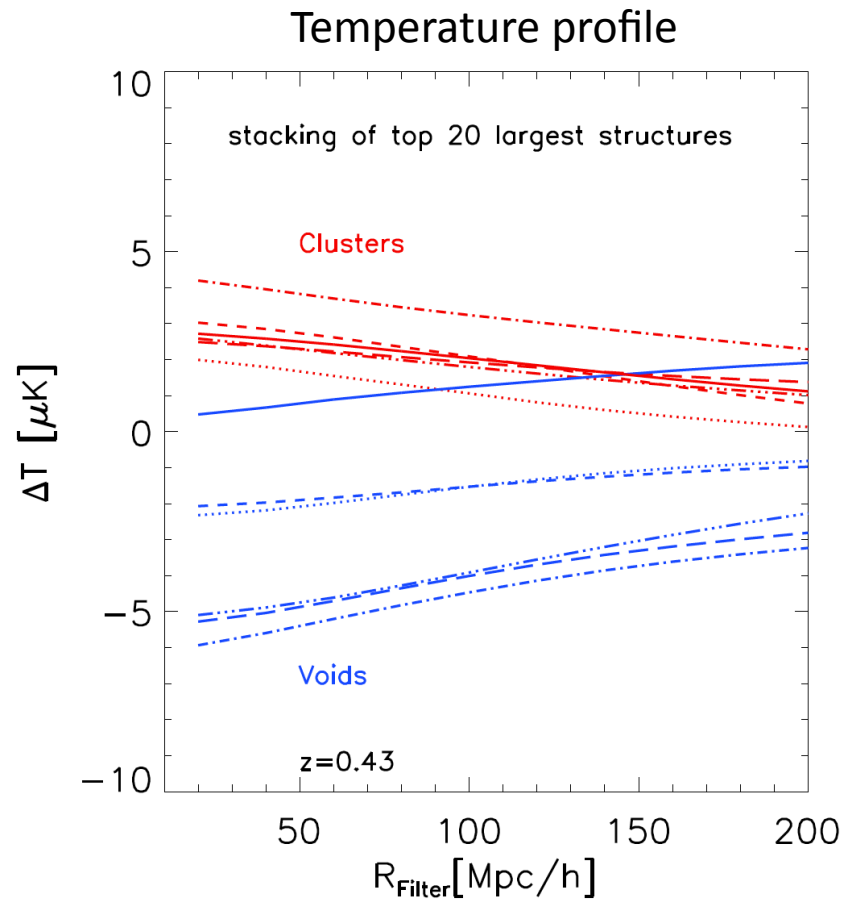

Stacking of simulated voids

Stacking of simulated clusters

Stacked temperature profile

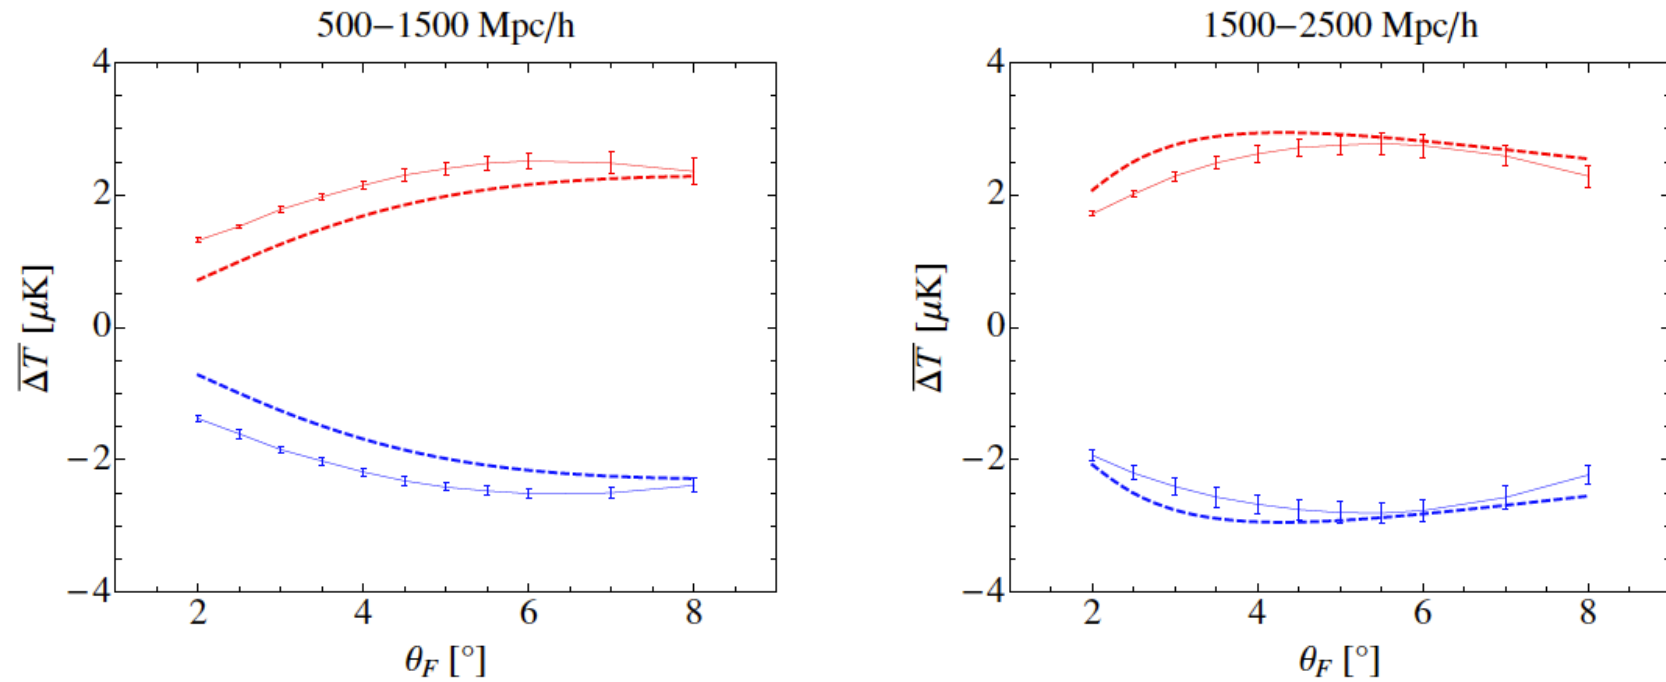

Tension with LCDM?

Flender et al. (2013), using simulated ISW maps from Cai et al. (2010)

Tension with LCDM?

Flender et al. (2013), using simulated ISW maps from Cai et al. (2010)

SDSS-DR7 void catalogues

Sutter et al. 2012

VOLUME-LIMITED SAMPLES USED IN THIS WORK.

Sample Name	Catalog	$M_{r,\max}$	z_{\min}	z_{\max}	Number of Galaxies	Mean Spacing ($h^{-1}\text{Mpc}$)
dim1	NYU VAGC	-18.9	0.0	0.05	63639	3
dim2	NYU VAGC	-20.4	0.05	0.1	156266	5
bright1	NYU VAGC	-21.35	0.1	0.15	113713	8
bright2	NYU VAGC	-22.05	0.15	0.2	43340	13
lrgdim	LRGs	-21.2	0.16	0.36	67567	24
lrgbright	LRGs	-21.8	0.36	0.44	15212	38

- Use ZOBOV (Neyrinck 2008) to find voids
- 1495 voids at $0 < z < 0.44$ from P. Sutter@V.Feb. 2013, or 1521 voids from M. Neyrinck

SDSS-DR7 void catalogues

Sutter et al. 2012

Risky to use all voids because:

1. Void sizes close to the mean galaxy spacing
2. Void-in-cloud

What is the optimal filter size?

What's the optimal filter radius

Where to draw the cut

Simulations:

$\Omega_m = 0.24$

$\Omega_L = 0.76$

$n_s = 0.958$

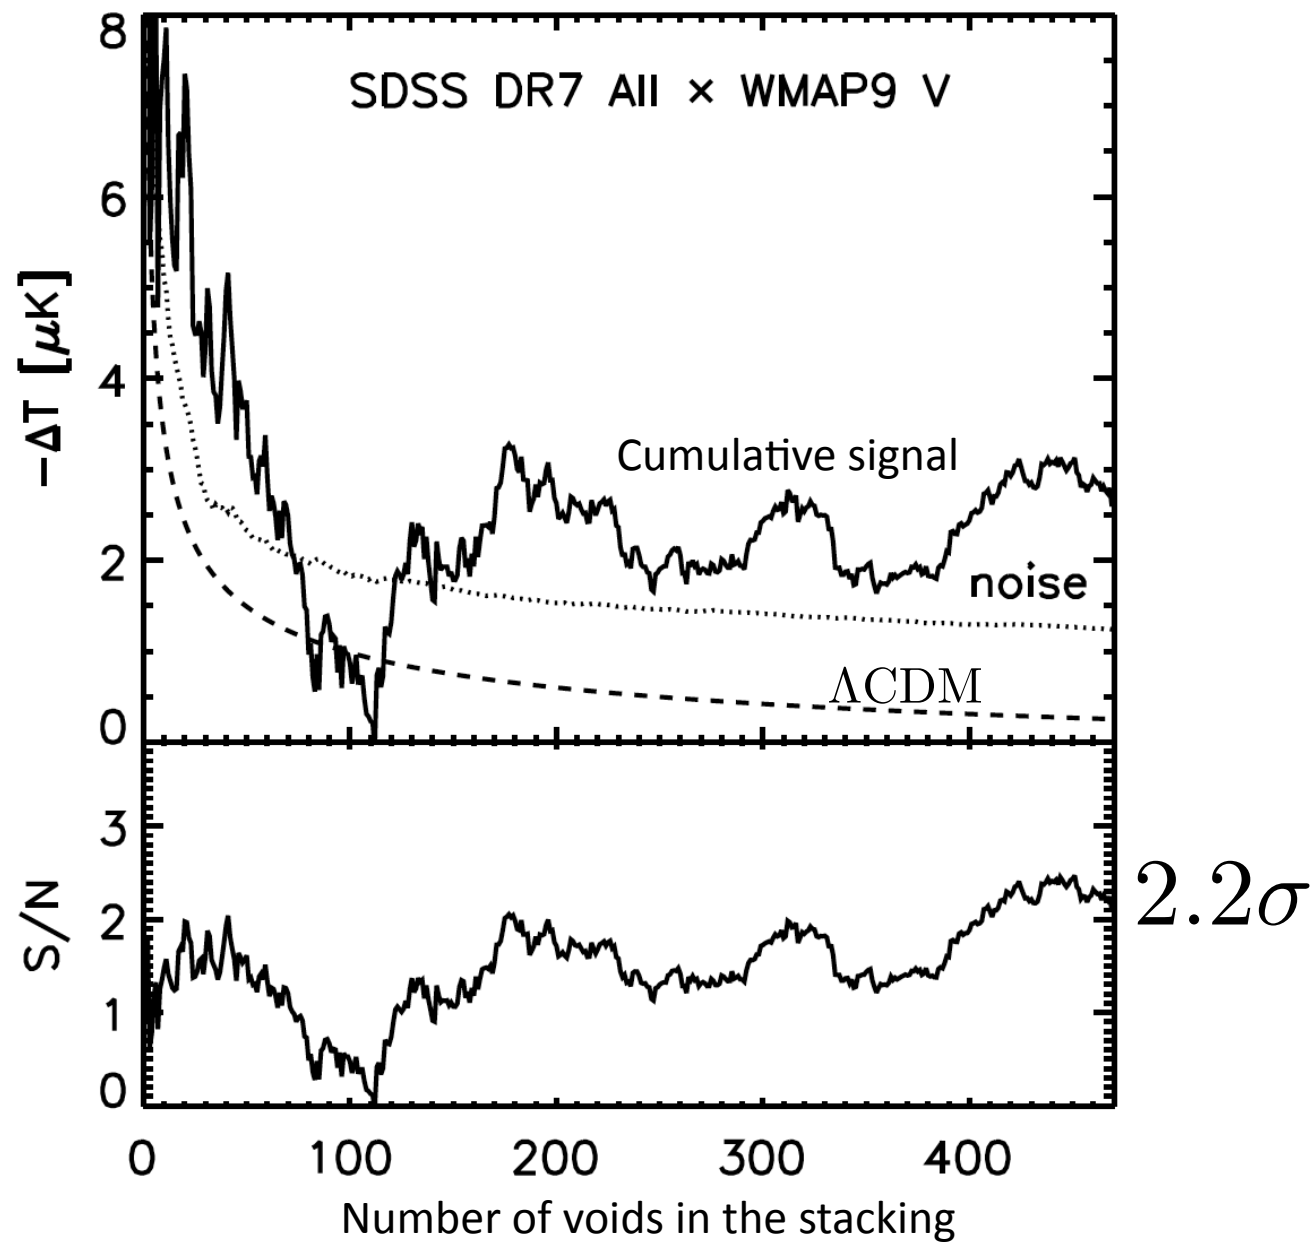

$\Sigma_8 = 0.77$

$h = 0.73$

Different boxsizes and
mass resolution to match
the number density of
galaxies in SDSS

For the 6 SDSS sub-samples

$r_{\text{cut}} = [20, 25, 30, 35, 45, 65] \text{Mpc}/h$

Weighted by void probability

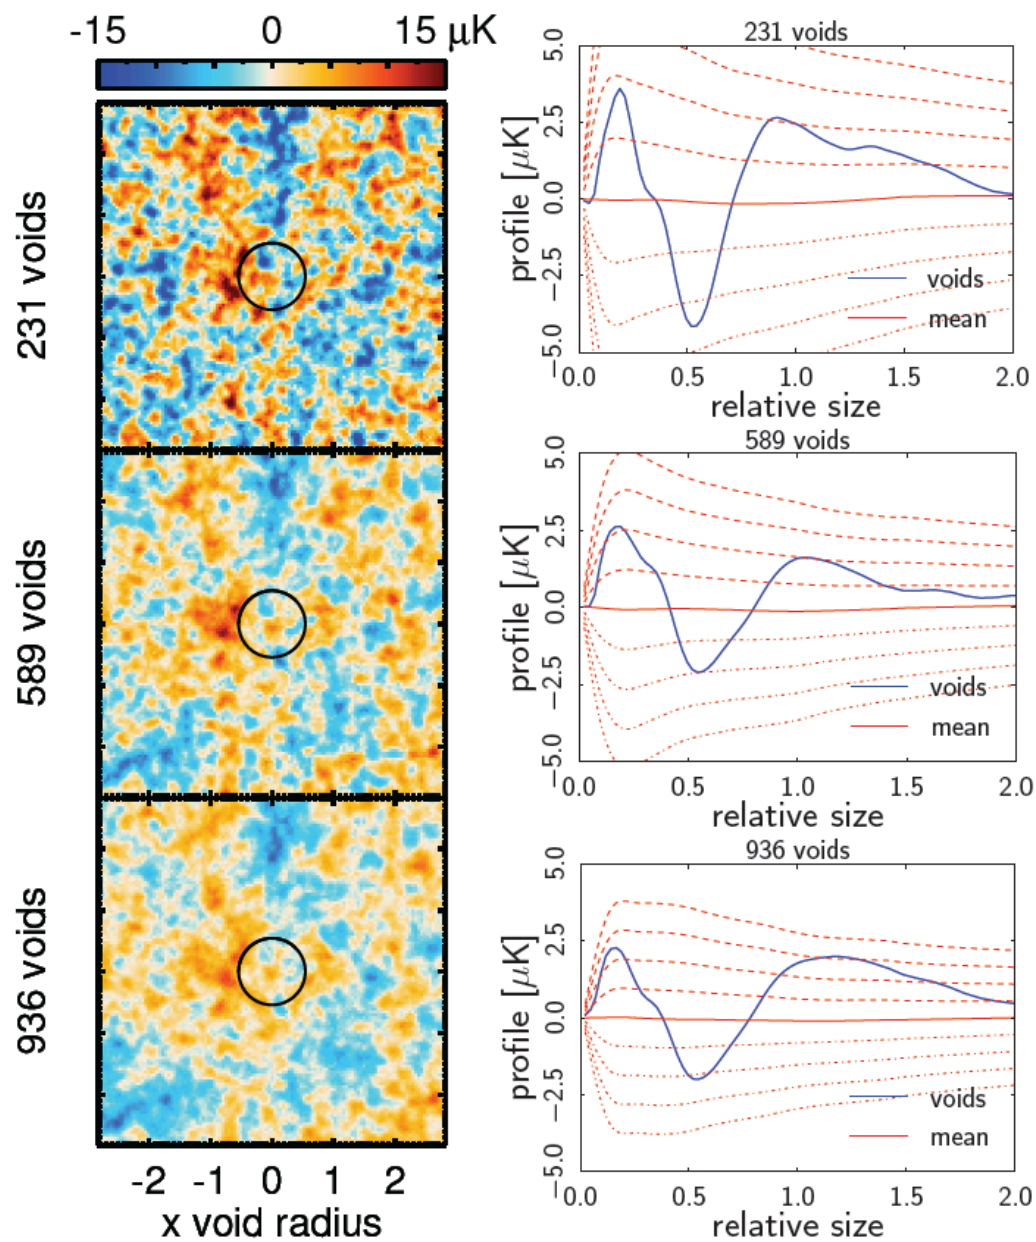

On the detection of the integrated Sachs-Wolfe effect with stacked voids

Stéphane Ilić, Mathieu Langer, Marian Douspis 2013

Planck 2013 results. XIX. The integrated Sachs-Wolfe effect

Ade et al. 2013

Summary

- 4-sigma detection of ISW from stacking of super-voids/clusters from SDSS-DR6-LRG catalog
- Simulated super-voids/clusters gives similar cold/hot spot as in observation, but the amplitude seems lower
- Hint for ~ 2 sigma ISW signal in the SDSS-DR7 catalog, not as significant as in SDSS-DR6-LRG catalog
- Puzzle remains, more volume is needed
